Preface

Hawaii's unprecedented economic growth during the past decade and its attendant water supply requirements have caused the legislative and executive branches of state government to broaden and intensify programs for the collection and publication of basic hydrologic data and for water resources planning, development, and management.

Chapter 176, H.R.S., provides the authority to initiate and conduct continuing water resources studies on a state-wide basis. The purpose of these studies is to formulate and publish for each major island a long-range, comprehensive plan as a general guide for the optimum development, utilization, and conservation of water resources. The Department of Land and Natural Resources, through its Division of Water and Land Development (DOWALD), is the agency responsible for implementing the state-wide water resources program.

A current objective is the formulation of a comprehensive water resources development plan for the island of Hawaii, similar in context to *Water Resources Development—Molokai*, published by DOWALD in 1966. This publication comprises an inventory of basic data on the surface and ground water resources of the island of Hawaii upon which to base the comprehensive water development plan.

The state's water resources program is consonant with the nation-wide movement to accelerate water resources development and is responsive to the federal government's efforts to encourage comprehensive water resources planning. The federal Water Resources Planning Act of 1965 (P.L. 89-80) established a national Water Resources Council and, under Title III, authorized grants to states for water resources planning. This publication has been produced with federal assistance under Title III.

Acknowledgments

Climatological and water supply data published in this report were provided by several government agencies, private organizations, and individuals, whose cooperation is gratefully acknowledged. Sources include previously published as well as hitherto unpublished data, specific acknowledgment of which would be impractical. It would also be difficult to list all of the participating individuals. Among the contributing organizations and agencies are the following:

PRIVATE ORGANIZATIONS

Bishop Estate	Kealakekua Ranch
Greenwell Ranch	Keeau Orchards
Hamakua Mill Company	Kohala Sugar Company
Hawaiian Agricultural Company	Kukaiau Ranch Company
Hawaiian Ranch Company	Laupahoehoe Sugar Company
H.S.P.A. Experiment Station	Mauna Kea Beach Hotel
Hilo Electric Company	Mauna Kea Sugar Company
Honokaa Sugar Company	McCandles Ranch
Honomalino Agricultural Company	Paaupau Sugar Company
Hualalai Ranch	Palani Ranch
Huehue Ranch	Parker Ranch
Hutchinson Sugar Company	Pepeekeo Sugar Company
Kahua Ranch	Puna Sugar Company
Kahuku Ranch	Puwaawaa Ranch
Kamehameha Development Corp.	

GOVERNMENT AGENCIES

Geological Survey, U.S. Dept. of Interior
Hawaii National Park, U.S. Dept. of Interior
Kilauea Military Camp, U.S. Dept. of Army
Soil Conservation Service, U.S. Dept. of Agriculture
Weather Bureau, U.S. Dept. of Commerce

Division of Environmental Health, Dept. of Health
Division of Forestry, Dept. of Land and Natural Resources
Kulani Prison, Dept. of Social Services

Hydrographic Areas

In order to facilitate the study of water resources, the island of Hawaii has been divided into five hydrographic areas based upon surface topography. These five areas are the major drainage basins of the island, each covering several watersheds.

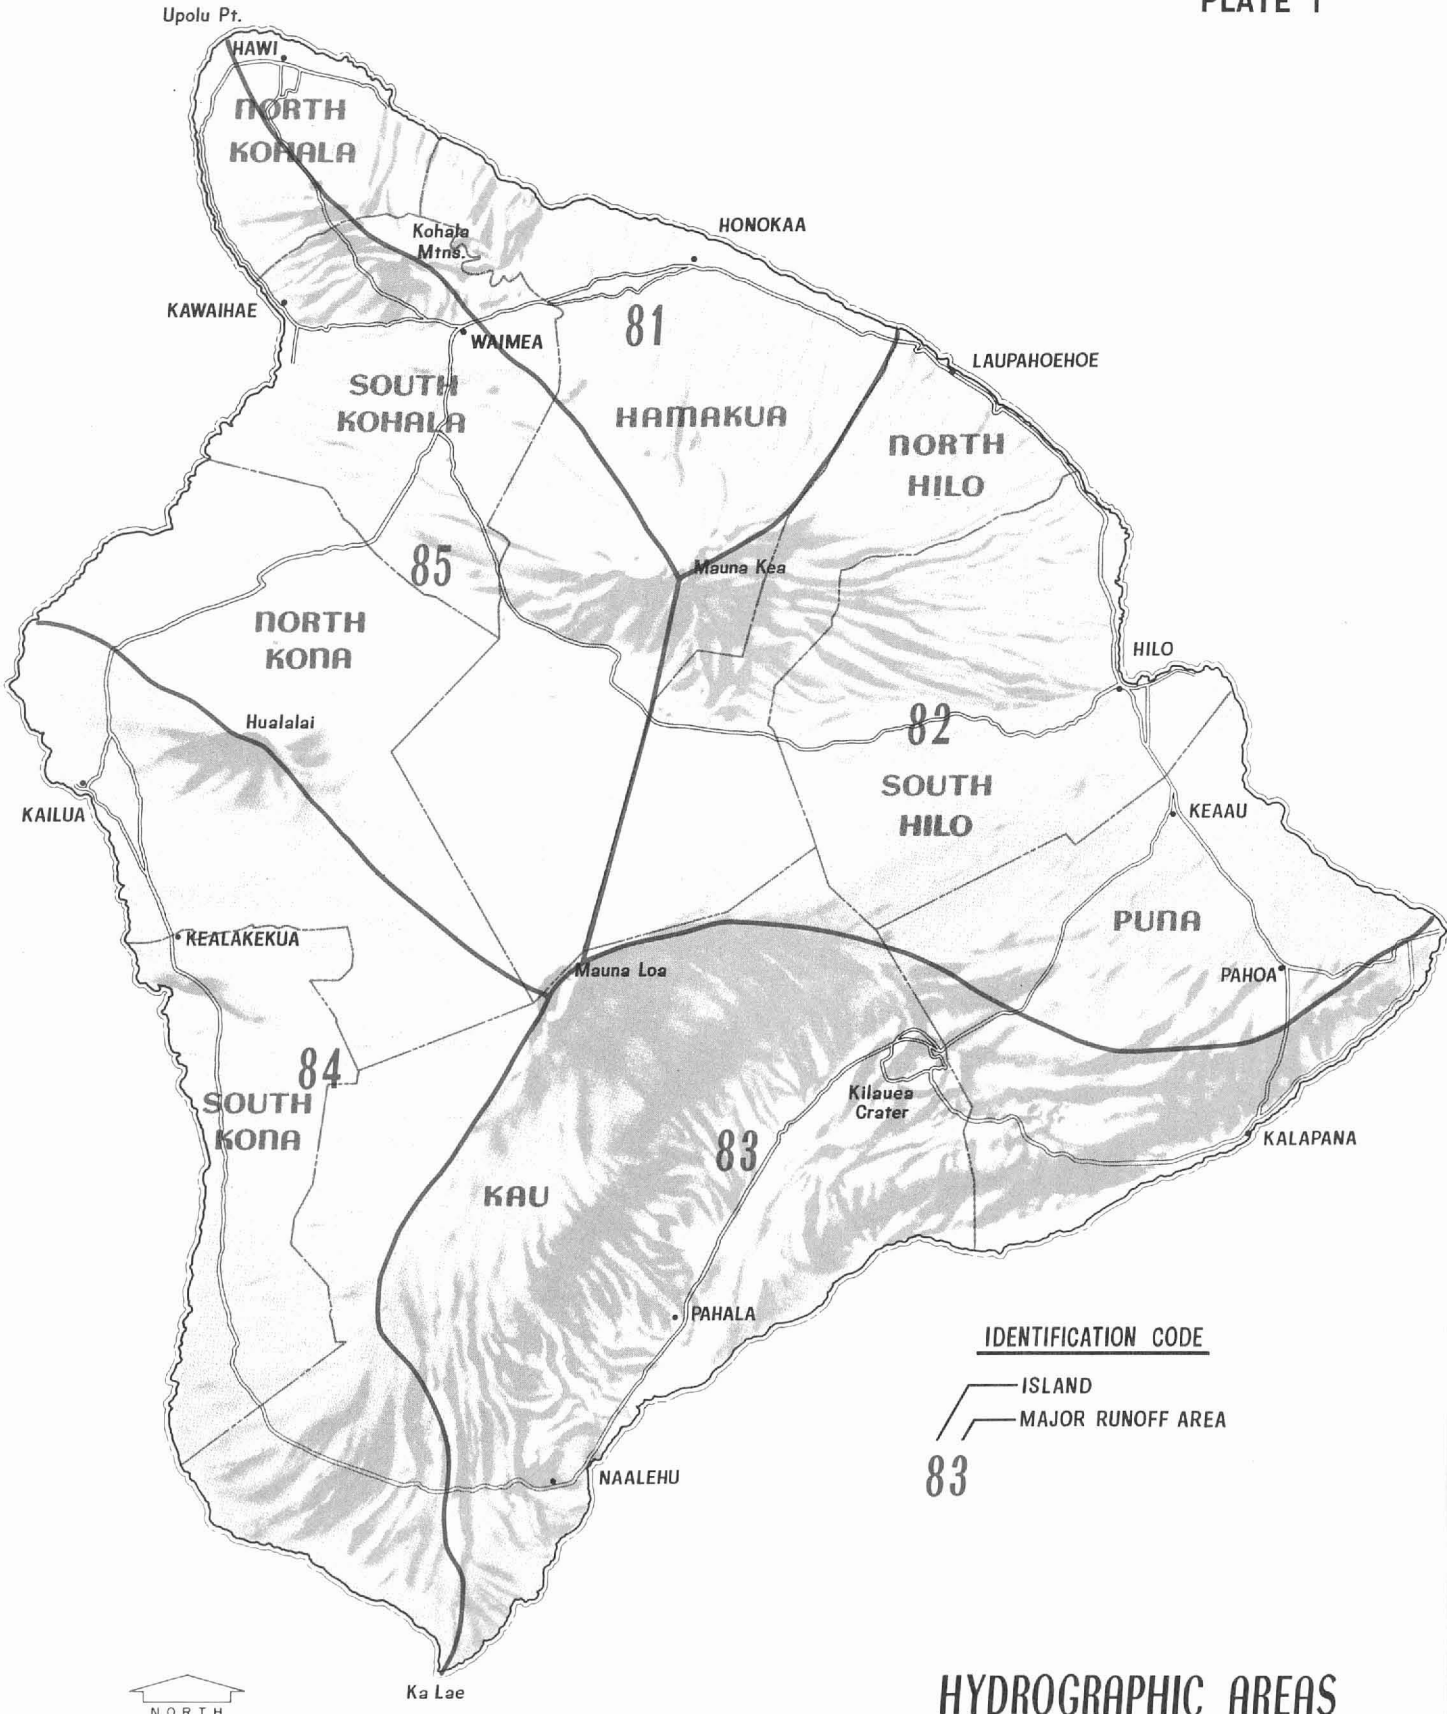

The numerical designations of hydrographic areas are part of the state-wide system of watershed identification which has been adopted for use by the Division of Water and Land Development (DOWALD) and also by the U.S. Soil Conservation Service. The first digit represents one of the eight major islands of the state, numbered consecutively from Niihau on the northwest in a southwesterly direction to Hawaii. The second digit identifies the hydrographic area, numbered from the northern tip of each island depending on the shape, size, and topography of

the island. Watersheds within a hydrographic area, when identified are designated by a third digit, numbered clockwise within the area. Decimal digits are used to identify sub-watersheds.

Hydrographic Area 81, Hamakua: the west portion of the northern slopes of the island, being also the northern slopes of Kohala Mountain and Mauna Kea, comprising an area of 375 square miles. Area 81 extends from a point on the coast about three-quarters of a mile west of Upolo Point (North Point) at the northern tip of the island, southeasterly along the coastline to a point about five-eighths of a mile southeast of the mouth of Kaula Stream; thence along the water divide southwesterly to the summit of Mauna Kea; thence northwesterly to the summit of Kohala Mountain and to the point of beginning.

View of Alakahi Canyon at head of Waipio Valley in Area 81, Hamakua in the background.

with land districts**

Another view of Waipio Valley and Hamakua, Area 81.

Hydrographic Area 82, Hilo: the east portion of the northern slopes of the island, being also the eastern slopes of Mauna Kea and the northeastern slopes of Kilauea, comprising an area of 1,049 square miles. Area 82 extends from a point on the coast about five-eighths of a mile southeast of the mouth of Kaula Stream near Ookala, southeasterly along the coastline to Cape Kumukahi (East Cape); thence along the water divide westerly to the east rim of Kilauea volcano and to a point on the divide two-sevenths of a mile northeast of the convergence of the Kau-North Hilo and North Hilo-Hamakua district boundaries; thence northeasterly to the summit of Mauna Loa and to the point of beginning.

Hydrographic Area 83, Kau: the southeastern slopes of the island, being also the southeastern slopes of Mauna Loa and Kilauea, comprising an area of 908 square miles. Area 83 extends from Cape Kumukahi (East Cape) at the eastern tip of the island, southwesterly along the coastline to a point seven-tenths of a mile northwest of Kalae (South Point); thence along the watershed divide northerly to the summit of Mauna Loa; thence easterly to the east rim of Kilauea Volcano and to the point of beginning.

View of Mauna Kea from the Saddle Road, showing an expanse of Area 82.

The "boiling pots" area of Wailuku River, located near the city of Hilo in Area 82.

Eruption of Kapoho Crater in southeastern tip of Area 83, near the border of Area 82.

Halemaumau Crater from observatory, famous visitor attraction in Area 83.

Hydrographic Area 84, Kona: the southwestern slopes of the island, being also the western slopes of Mauna Loa and the southern slopes of Hualalai, comprising an area of 795 square miles. Area 84 extends from a point on the coast seventh-tenths of a mile northwest of Kalae (South Point) at the southern tip of the island, northwesterly along the coastline to Keahole Point (West Cape); thence along the water divide southeasterly to the summit of Hualalai and to the summit of Mauna Loa; thence southerly to the point of beginning.

Hydrographic Area 85, Kohala: the northeastern slopes of the island, being also the northern slopes of Hualalai, the northeastern slopes of Mauna Loa, the western slopes of Mauna Kea, and the southwestern slopes of Kohala Mountain, comprising an area of 903 square miles. Area 85 extends from Keahole Point (West Cape) at the western tip of the island, northeasterly along the coastline to a point about three-quarters of a mile west of Upolu Point (North Point); thence along the water divide southeasterly to the summit of Kohala Mountain, and to the summit of Mauna Kea; thence southerly to a point on the divide two-sevenths of a mile northeast of the convergence of the Kau-North Hilo and North Hilo-Hamakua district boundaries; thence southwesterly to the summit of Mauna Loa; thence northwesterly to the summit of Hualalai and to the point of beginning.

Above: Panoramic sweep at Kealahou, Kona, in Area 84. Below: Corral at 4,000 feet elevation on Huehue Ranch, Mt. Hualalai in background, located in Area 84 near 85.

Scenes in Area 85. Above: Pasture and small farms at Waimea. Right: Leeward slopes of Kohala Mountain, Kawaihae Harbor in background. Below: Mt. Hualalai in the distance, viewed from Waimea.

Although the island of Hawaii lies within the tropics, its climate is semi-tropical and varies locally with elevation and orientation to the tradewinds. In general, the climate is characterized by two seasons a year, by mild and fairly uniform temperatures except at higher elevations, by prevailing tradewinds, by marked differences geographically in rainfall patterns, and by typically humid and cloudy conditions except in leeward coastal areas and at higher elevations.

The island lies in the path of northeasterly tradewinds which are relatively uniform and persist throughout most of the year. Wind speeds over the ocean surrounding the island do not exceed 12 mph more than half the time. The wind pattern is a key factor in the determination of rainfall and affects humidity, evaporation, and temperature.

Most of the rainfall on the island's eastern side results from the cooling of the moist tradewinds as they rise and flow over Kohala Mountain and are deflected around the higher mountain masses of Mauna Kea and Mauna Loa. The leeward side of the island is generally dry, except in the Kona area where convective storms are common. Infrequent major storms of the cyclonic type, known as "Kona storms," occur principally in the winter.

Because of the mild, equable temperatures of the ocean waters surrounding the island, temperatures in the air moving across the ocean and over the island are also mild and equable. The warmest month is August and the coldest is February.

Temperatures decrease uniformly with elevation to an inversion level where the tradewinds are overlain with winds moving poleward, usually between 5,000 and 7,000 feet. Relative humidity below the inversion level is high; above the inversion, the air is drier.

Evaporation varies with rainfall, wind exposure, cloud cover, and temperature. The rate is highest in arid leeward regions.

Each aspect of climatology on the island of Hawaii is inventoried in this section, following an Alphabetical List of Climatologic Stations, pages 9-11. Records relating to and characteristics of rainfall, temperature, evaporation, wind, and humidity are discussed and illustrated, following which stations are indexed and selected records are presented.

CLIMATOLOGY

Mountain mists in rain forest exposed to moisture-laden tradewinds, Kawainui Stream, Kohala.

Rainfall

RAINFALL STATIONS AND RECORDS

Rainfall records on the island of Hawaii have been kept for many years by the U.S. Weather Bureau, other government agencies, private companies, and individuals. The earliest records were begun at Hilo by Rev. Titus Coan in 1846 (No. 86.4), and since that time the number of rain gages has gradually increased until records from 603 rainfall stations are now available. The longest continuous records extend back about 81 years, but most of the records with an early beginning have intermittent periods of record.

The location of all rainfall stations on the island of Hawaii is shown in Plate 2. Most of the 655 stations plotted on the map are located along the windward side of the island, from the northern tip at Upolu Point (No. 159.2) to Kalae (South Point, No. 1), in Kau. On the lee side of the island, rainfall stations are located throughout

the settled central areas of the Kona District. In contrast, there are only a few stations in the central upland areas of the island and along the coastal areas of North Kona and Puna, where access is difficult.

All rain gages of record through 1967 on the island of Hawaii are listed in the Rainfall Station Index on pages 21-45. Of the 450 active gages, 151 are maintained by the 10 sugar plantation companies. The remaining 299 gages are maintained by other private entities, various government agencies, and individuals. Only the 148 listed official Weather Bureau gages, of which 66 are active, have published records.

Climatologic stations are indexed in this report in numerical order according to state key numbers assigned by DOWALD, and not according to gage names or gage numbers, commonly designated by the observers. The numbering system for climatologic stations listed in the Rainfall Station Index provides a key to their

Standard recording rain gage showing compartment housing chart for 96-hour period.

A calibrated dip stick is used to measure rainfall collected in standard 8-inch gage.

geographic location. Gages on the island of Hawaii are numbered from 1 to 223, proceeding from south to north, and from east to west within each five-minute latitude band. The decimal system is used to designate stations in areas where whole numbers have been exhausted.

A cross reference to the numerical listing of rain gages is presented in the Alphabetical List of Climatologic Stations on pages 9-11. Because the climatologic stations are located by each of their different names or gage numbers, there are more entries in the Alphabetical List than there are actual stations. If the name of a station is known and its location desired, the station number may be determined from the Alphabetical List and the station identified as to location on the rainfall station location map (Plate 2).

For many years, the observed rainfall records of official Weather Bureau stations have been published, but the records of the unofficial gages maintained by other government agencies, private companies, and individuals have not been published. These unofficial rainfall records were kept in the open files of the Weather Bureau until transferred to the Division of Water and Land Development (DOWALD) in January, 1960.

By mutual agreement with the Weather Bureau, DOWALD now has the responsibility for collecting, collating, and maintaining all rainfall records from climatologic stations throughout the state except official Weather Bureau stations. Those unpublished rainfall records since 1948 which are not retained by the observers and all records included in the Weather Bureau's publication, *Climatological Data, Hawaii*, are now kept in the open files of DOWALD in the State Office Building, Honolulu, and are available to all agencies and individuals for reference. This open file represents probably the most complete source of rainfall records in the state. Many of the records of the unofficial rainfall stations prior to 1948 are available only in the observers' files.

Data published in Selected Rainfall Records, pages 46-78, comprise monthly and annual rainfall at all official Weather Bureau stations on the island of Hawaii with records of 15 years or more (including some discontinued gages), together with data from other selected gages having records of 10 years or more. The latter were selected to provide more comprehensive coverage where Weather Bureau gages are sparse. Tabulations include total measured rainfall and means, maximum, and minimum rainfall for the periods of record. Mean rainfall has been computed by dividing the years of record into total rainfall.

Standard 3-inch metal reduction tube also requires use of dip stick for measurement.

Typical wedge-shaped rain gage used at unofficial stations has etched calibrations.

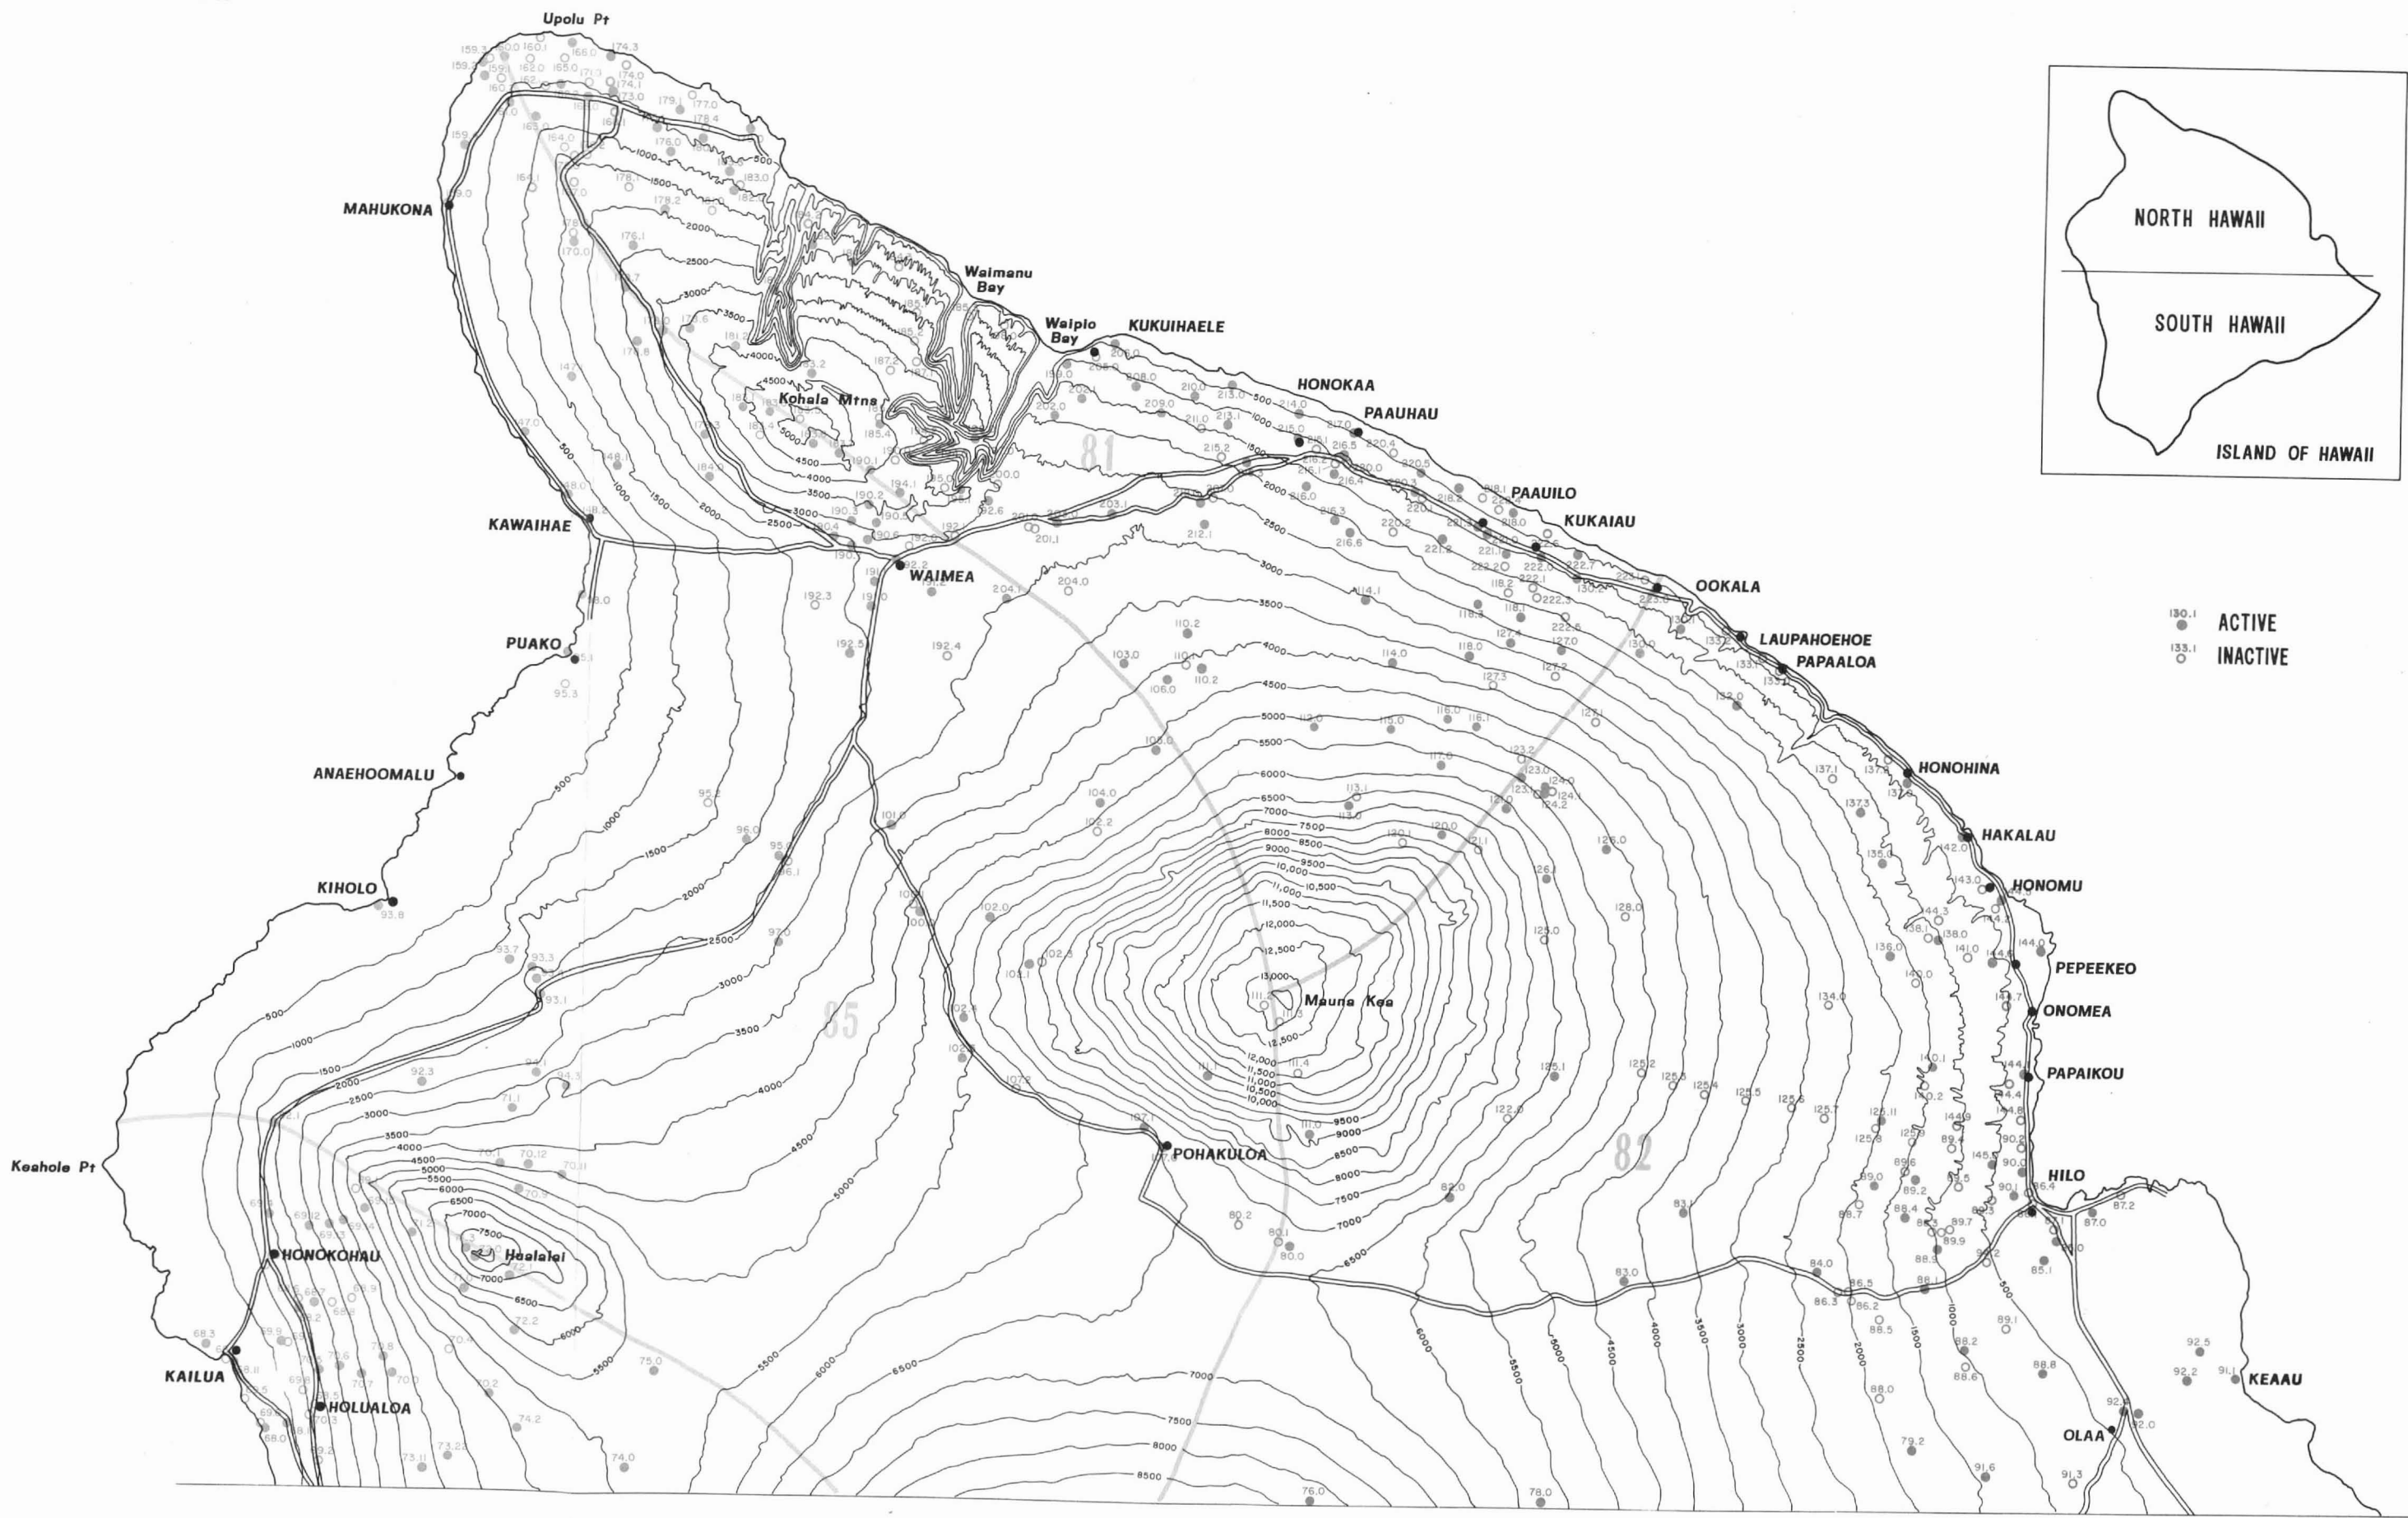

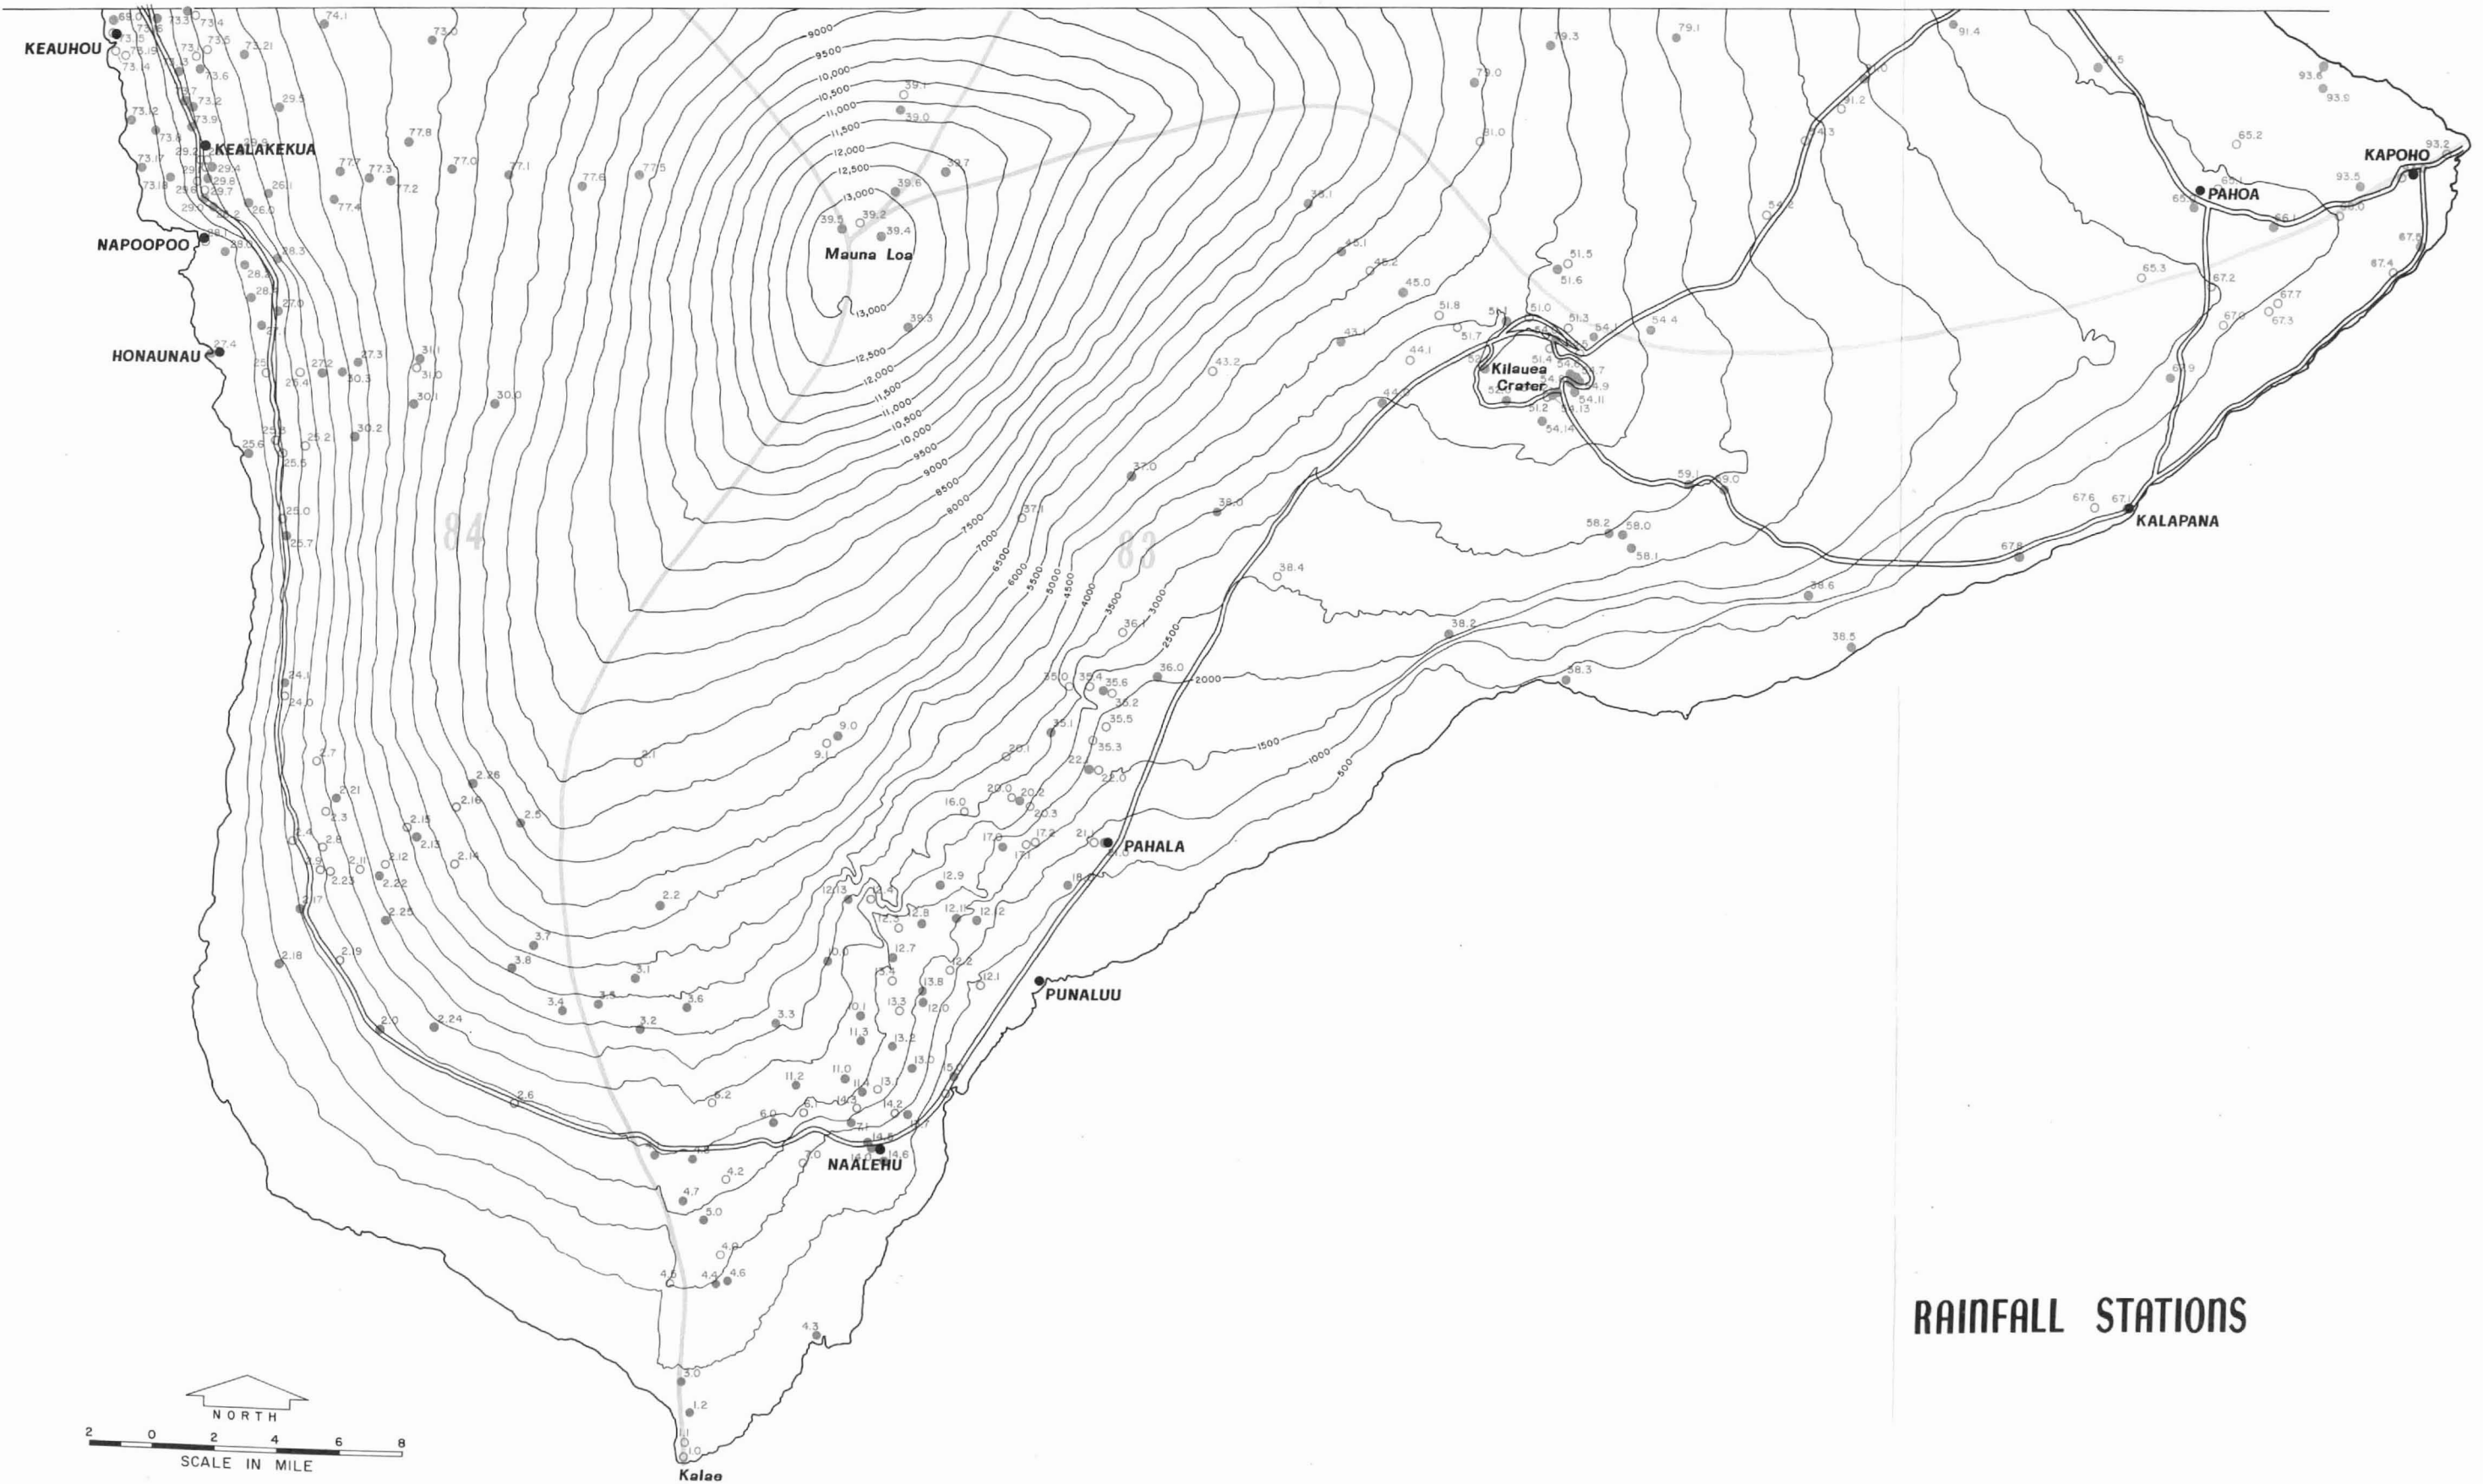

Station No. 76, Kulani Mauka, is an official U.S. Weather Bureau climatologic station which includes among its weather recording instruments both a standard 8-inch rain gage and a recording gage.

Rainfall is measured in 8-inch gage at Huehue Ranch at Kailua-Kona, Station No. 92.1.

Official climatologic station at Pahala, No. 21, includes typically mounted 8-inch gage.

RAINFALL STATIONS

Workers are silhouetted against the sky as they install a recording rain gage within a protective enclosure at Kohakohau, Station No. 190.2, located above the town of Waimea at 3,725 feet elevation.

RAINFALL CHARACTERISTICS

The island of Hawaii, lying in the path of the northeast tradewinds, has an orographic rainfall pattern typical of the larger islands in the Hawaiian chain. The moisture-laden trades are cooled as they rise up the mountain slopes and lose part of their moisture as rain. The prevalence of the trades throughout much of the year accounts for the high annual rainfall of 75 to more than 300 inches on the windward, northeast side of the island.

Orographic rainfall increases with elevation, reaching a maximum intensity from 2,000 to 3,000 feet elevation and then diminishing, so that upper slopes are semi-arid. This pattern is typical of the Hamakua coast and upper slopes of Mauna Kea, for example. In north Hawaii, the trades release much of their moisture before reaching the summit of Kohala Mountain (elevation 5,505 ft.). As the winds descend on the leeward slopes and become drier and warmer, rainfall declines accordingly and results in near-arid climate (mean annual rainfall, 10 inches) along the Kawaihae coastline.

Rainfall along the Kona coast on the west side of the island, is atypical of the general pattern. The volcanic peaks of Mauna Kea and Mauna Loa, with elevation in excess of 13,000 feet, split the trades on the windward side and divert them around the mountain masses. Similarly, the 8,200-foot peak of Hualalai in Kona diverts the limited northeast flow which has penetrated the Mauna Loa-Mauna Kea saddle. As a result, the tradewinds do not reach most of the Kona district and cause only minimal orographic rainfall. However, the difference between land and water temperatures along the Kona coast on warm days, particularly in summer, generates moderate seabreeze circulation which results in showers. This rainfall is typically spotty in distribution and highly variable in duration and intensity, but the showers are frequent and heavy enough to produce a much higher mean rainfall in Kona than in other leeward areas.

Relatively infrequent but significant cyclonic disturbances disrupt the prevailing tradewind circulation and cause heavy rainfall. These disturbances, locally called "Kona storms," usually occur during the winter months, are accompanied by winds from a southerly-southwesterly direction, and often account for most of the annual rainfall in the areas to leeward of the mountain masses.

The isohyetal map (Plate 3) shows mean annual rainfall on the island of Hawaii. The isohyetal lines (contours of equal rainfall) are based upon mean values determined from actual or

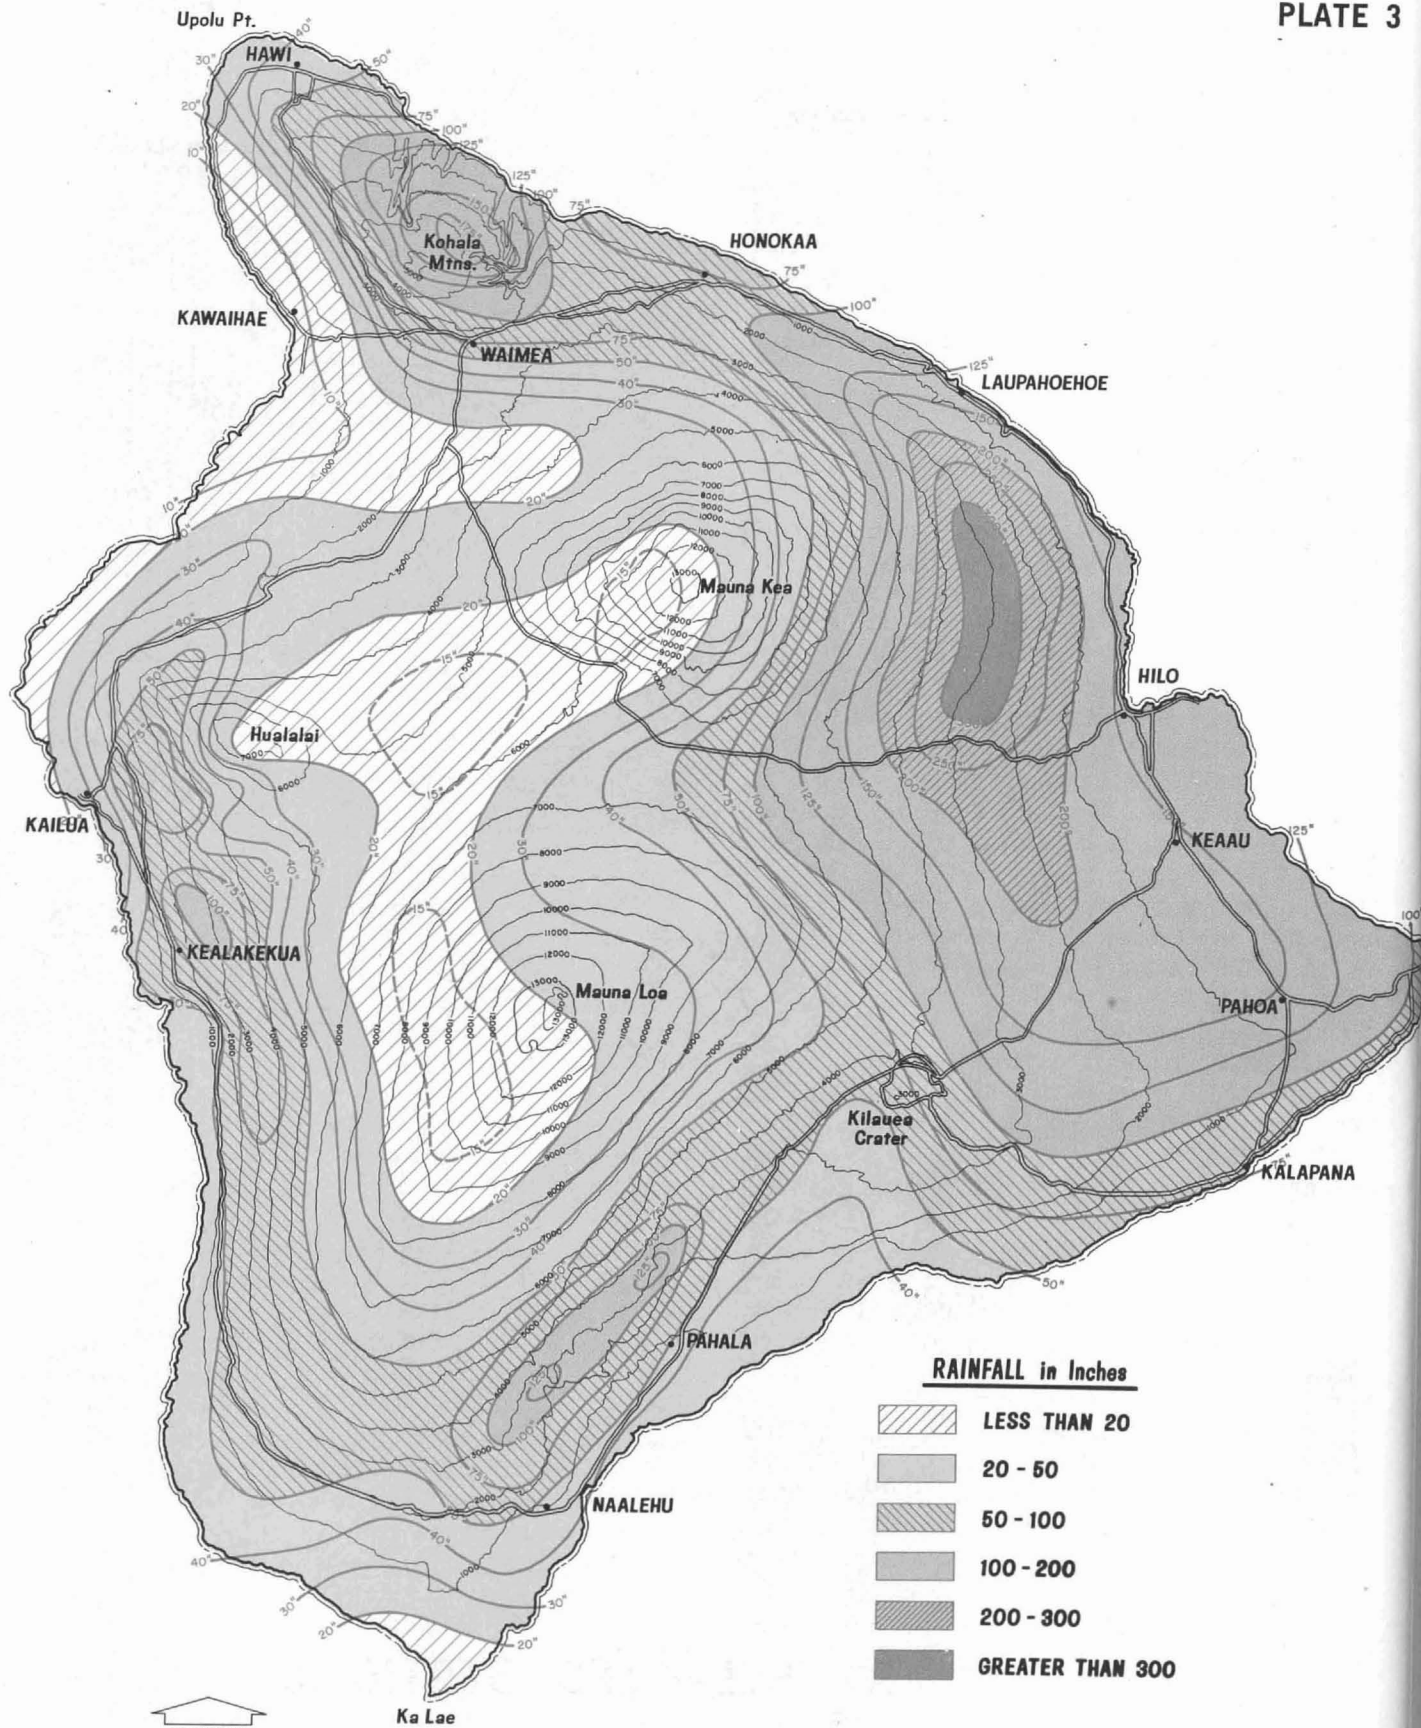

On Kohala Mountain, where mean rainfall is 175 inches, sphagnum moss enshrouds ohia.

extrapolated rainfall records from 97 gages for the 25-year period 1931-1955. The selected rainfall stations and their respective mean values are plotted on the map. The distribution of rainfall illustrated by the isohyetal contours on Plate 3 remains relatively similar throughout the year, although volume varies seasonally.

The range of annual rainfall on the island of Hawaii is also typical of the Hawaiian Islands in general. On Plate 3 the interception of the prevailing northeast trades is clearly evidenced by the heavy annual rainfall in the windward areas. Heaviest annual rainfall occurs in the vicinity west of Hilo, at 2,000-3,000 feet elevation, where mean rainfall exceeds 200 inches. Annual rainfall is lightest on the leeward slopes of Kohala Mountain in the north and at higher elevations on Mauna Kea and Mauna Loa.

Generally, in areas where the trades predominate, the dry months of the year occur from May through September and the wet months from October through April. However, in the atypical Kona region, sheltered from the trades, summer rainfall predominates. Monthly rainfall patterns at selected rainfall stations are graphically illustrated in Plate 4 by bar graphs of mean rainfall for the respective periods of record.

MEAN ANNUAL RAINFALL

RAINFALL AT SELECTED STATIONS

Rainfall deficiencies in the Mauna Kea saddle are compensated for by transferring water from the wet Kohala region, in the background, to several storage reservoirs such as the one shown above.

The volume of annual rainfall on the entire island of Hawaii and in each hydrographic area has been computed from Plate 3. Mean annual rainfall in areas between isohyets was assumed to be the average of the adjacent isohyets. Products of the areas included between adjacent isohyets and the depths of rainfall were added to obtain the average volume of rainfall in each of the hydrographic areas.

The results for each hydrographic area and for the island as a whole are summarized in the accompanying table. The table shows that the island of Hawaii receives an average of about 75 inches or approximately 5.25 billion gallons of rainfall annually.

VOLUME OF ANNUAL RAINFALL

HYD. AREA	AREA (sq.mi.)	ANNUAL RAINFALL (in.)	ANNUAL RAINFALL (m.g.)	PERCENT OF TOTAL

Temperature

TEMPERATURE STATIONS AND RECORDS

Like rainfall records, temperature records on the island of Hawaii have been kept for many years by the U.S. Weather Bureau, other government agencies, private companies, and individuals. Temperature stations on the island are not as numerous as rainfall stations, however, nor are the periods of record as long-term.

The earliest temperature records were begun in 1893 at several stations: Kealakekua-Davis (No. 29.1), Volcano House (No. 51.4), Holualoa-1450 (No. 68.5), Laaloa (No. 69.11), Pepeekeo Makai (No. 144), and Kohala Mission (No. 175.1). Of the foregoing pioneer stations, all except the Kohala Mission station have been discontinued.

Presently there are 121 active temperature

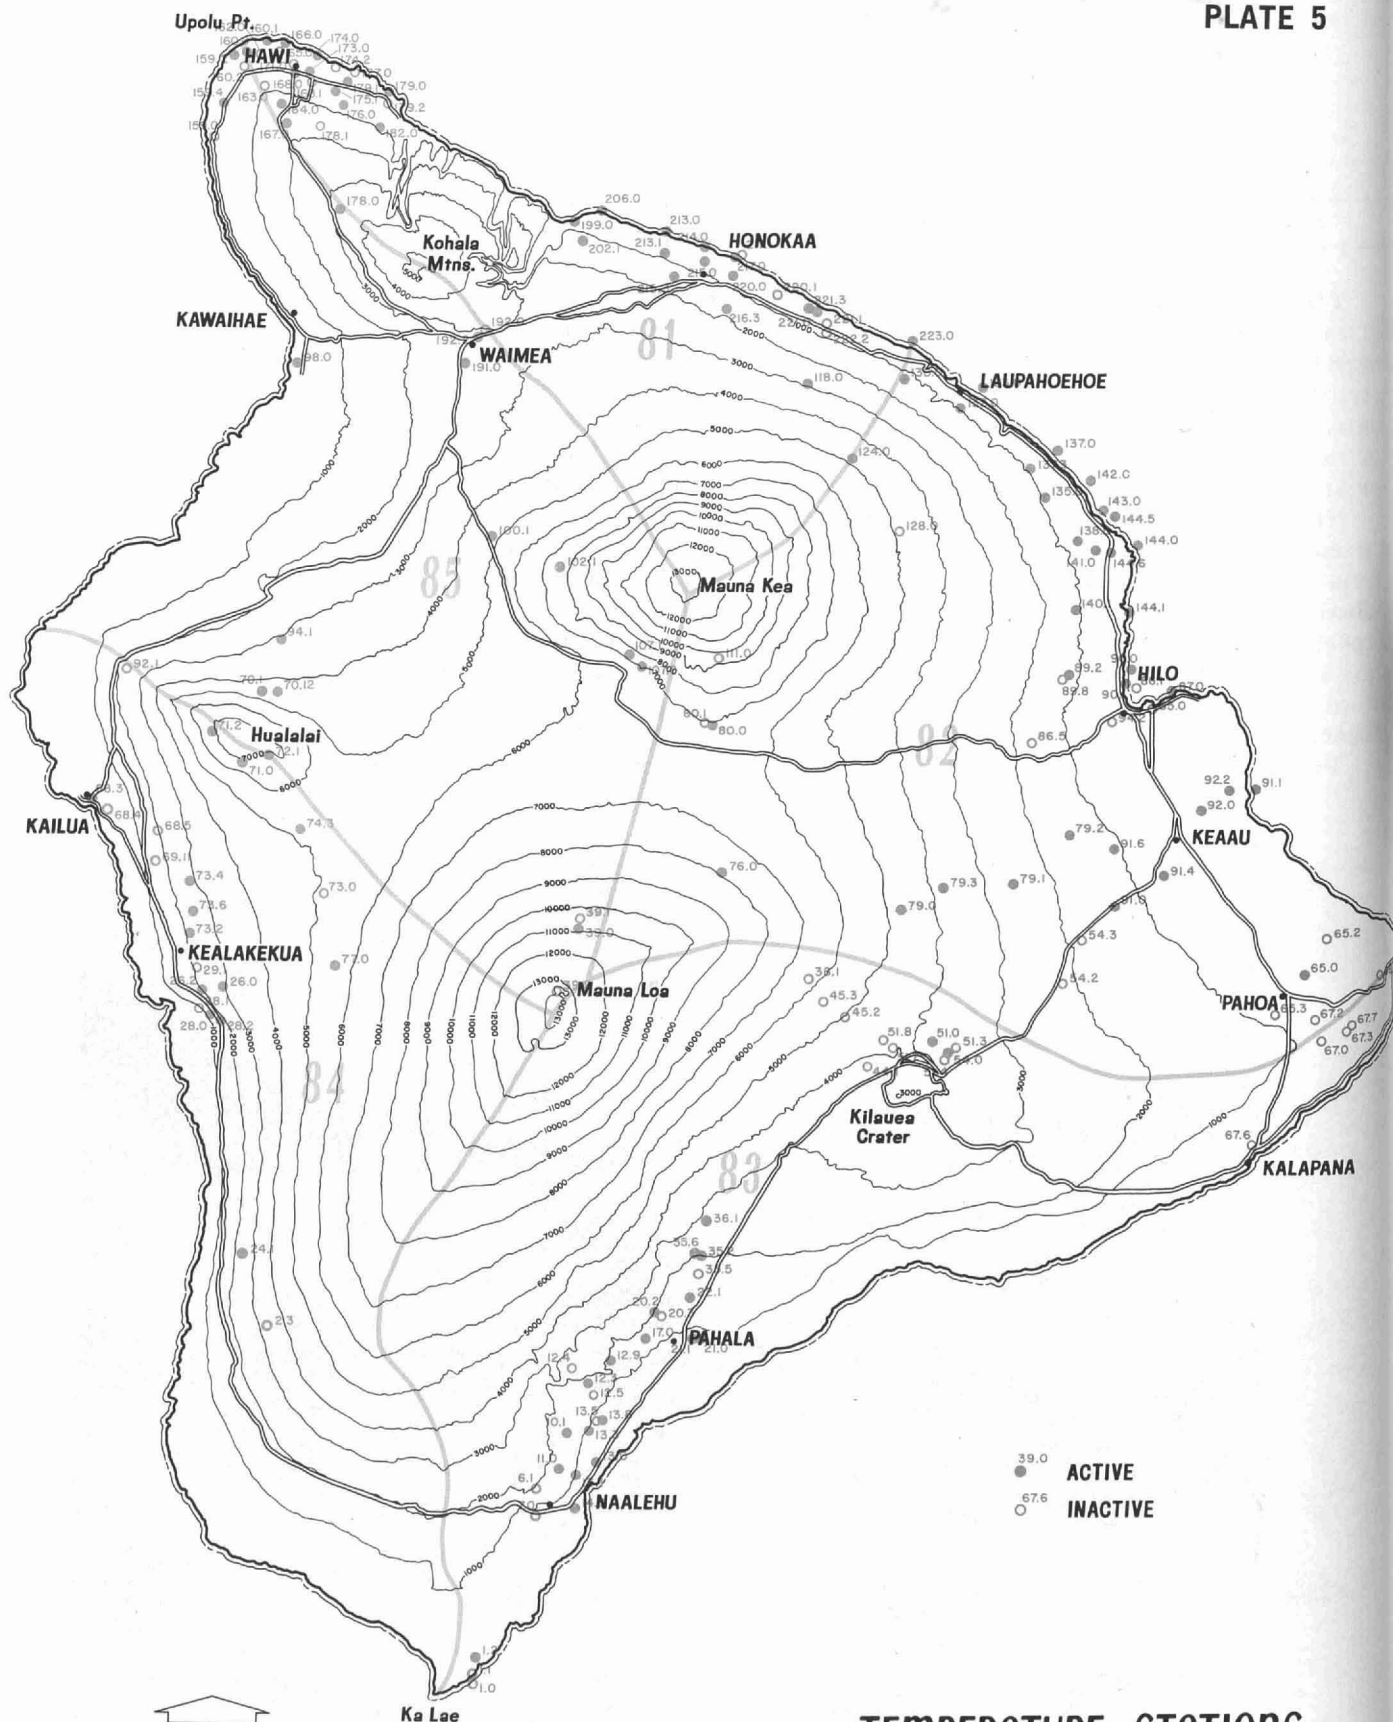

stations on the island, their distribution shown on Plate 5. Also shown are the locations of stations for which temperature observations are no longer being made.

Temperature Station Index, pages 85-91, provides a complete reference to all temperature stations with available records, current through 1967. Temperature stations totalling 167 are listed in numerical order according to assigned state key numbers. A cross reference to this numerical listing is presented in the Alphabetical List of Climatologic Stations, pages 9-11. (See Rainfall section of this report for climatologic station numbering system.)

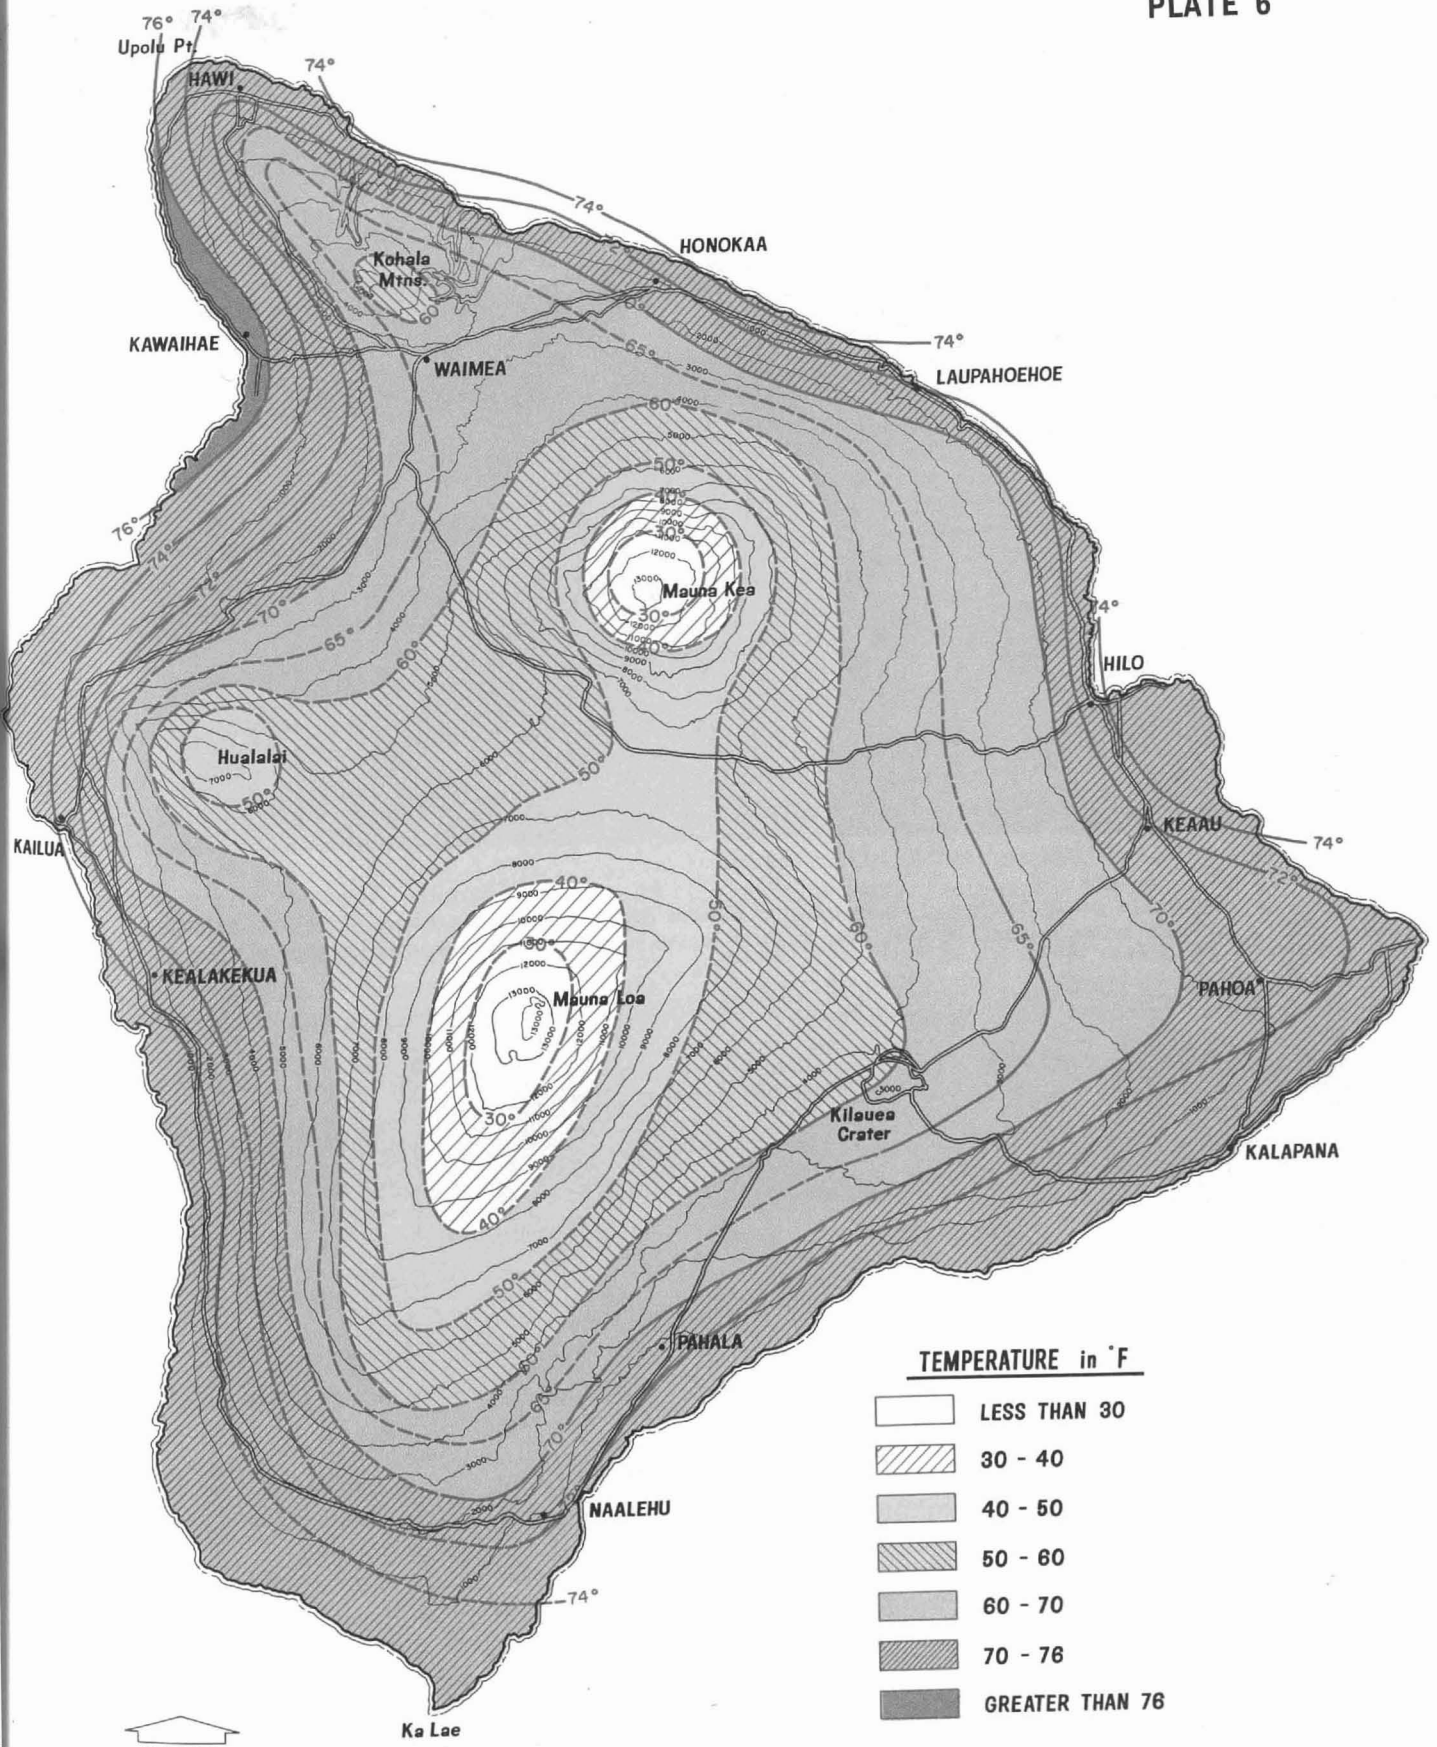

Tabulated monthly and annual temperature data, together with mean maximum and minimum temperatures, are presented in Selected Temperature Records, pages 92-102. All available station records are included.

Barren lava atop Mauna Kea at Lake Waiau, where estimated average temperature is less than 45°F.

TEMPERATURE STATIONS

Mauna Kea wears patches of snow, while at Hapuna Beach at Kawaihae, about 13,000 feet below and some 25 miles distant, bathers find respite in the surf from temperatures ranging into the 90's.

Left: Single max-min thermometer is U-shaped tube, the left leg indicating minimum and the right leg maximum temperature.

Below: Separate maximum and minimum thermometers properly mounted and in correct "set" position.

TEMPERATURE CHARACTERISTICS

Temperature depends almost entirely on elevation, although affected somewhat by slope, wind exposure, and cloud cover. Thus, regular sequences, dissimilar to those typical of rainfall, are characteristic of monthly temperatures on the island of Hawaii.

Records show that mean temperature decreases at an approximate rate of 1°F for each 300 feet increase in elevation, the rate being somewhat greater at the lower elevations. The daily temperature range increases approximately 1°F for each 300 feet increase in elevation.

The level at which the uniform rate of temperature change is halted or reversed usually ranges from 5,000 to 7,000 feet elevation. This "temperature inversion" is generally associated with tradewind air circulation, warm air rising at the Equator, flowing toward the North Pole above the inversion level, and returning below the inversion level from the northeast (rather than due north, because of the earth's rotation on its axis). The ceiling of tradewind clouds is generally at the inversion level.

Highest daily temperature in leeward areas, having less cloudiness, are usually greater than in windward areas. The range of mean monthly temperature from summer to winter is slight, also increasing with elevation. August and September are the warmest months; January and February are the coolest. Mean annual temperature variations are also slight.

Temperatures above 90°F are very unusual, except in the dry leeward area of South Kohala where maximum temperatures in the low 90's are moderately common. The island's highest recorded temperature, 96°F , occurred in 1967 at Mauna Kea Beach (No. 98), elevation 103 feet, where the mean annual temperature is 78.4°F .

Except at elevations above 2,500 feet, temperatures less than 55°F are uncommon. The lowest temperature of record on the island, 22°F , also occurred in 1967, at Mauna Loa Slope Observatory (No. 39), elevation 11,145 feet, where mean annual temperature is 43.8°F . Atop Mauna Loa (No. 39.1), elevation 13,455 feet, mean annual temperature is 42.9°F . The summits of Mauna Kea and Mauna Loa are frequently covered with snow in winter. Frost rarely occurs below 4,000 feet elevation.

Mean temperature on the island of Hawaii is graphically depicted in Plate 6. The spaces between isotherms (lines of equal temperature) from the coast to mountain peaks indicate the decrease of mean temperature with elevation, the more widely spaced isotherms generally coinciding with similar contour intervals denoting less slope. Four distinct temperature lows occur at mountain peaks.

Plate 7 plots maximum and minimum temperatures at selected stations, showing decrease with elevation and only slight seasonal variations. Minimum temperatures, occurring at night, are characteristically more regular than maximum temperatures, the latter fluctuating to the extent that a typical pattern is not discernible.

Evaporation

EVAPORATION STATIONS AND RECORDS

Measurement of unrestricted and unlimited natural evaporation of water from a shallow pan provides data useful in estimating water loss through evaporation from larger bodies of water and transpiration from plants. Evaporation data are necessary for water resources planning and are especially helpful to the hydrologist and agriculturist. The evaporation stations maintained by sugar plantations provide data to estimate the consumptive use of water by sugar cane and to determine the volume and scheduling of irrigation applications.

U.S.W.B. standard Class "A" pan, 48 inches in diameter and 10 inches deep, with stilling well to minimize water surface variations and fluctuations.

In comparison with other climatological records, evaporation data for the island of Hawaii are meager. The first pan evaporation gaging station on the island was established in 1911 at Naalehu (No. 14). Since no great importance was then attached to evaporation measurements, only a few stations were maintained and only for short

periods. More stations have been established on the island in recent years, however, with recognition of the value of evaporation data for agricultural purposes.

There are at present 18 active evaporation stations, sparsely scattered throughout the island of Hawaii, primarily in the lower elevations (see Plate 8). Most stations are located on sugar plantations along the Hamakua and North Kohala coasts. All of the island's evaporation stations, with the exception of the U.S. Weather Bureau's station at Hilo Airport (No. 87), are maintained by the Hawaiian Sugar Planters Association or its member plantations.

A compilation of all 33 pan evaporation gaging stations on Hawaii having available records is presented in the Evaporation Station Index, pages 106-107. Many of the stations have short periods of record, the longest period being 14 years. The station established at Naalehu (No. 14) in 1911, was discontinued after half a year of operation and reactivated in 1962. A cross reference to the numerical listing is presented in the Alphabetical List of Climatologic Stations, pages 9-11. (See Rainfall section of this report for climatologic station numbering system.)

Because of the sparsity of evaporation data, records of unofficial stations, even those with short periods of record, have been published with official U.S. Weather Bureau data in *Selected Evaporation Records*, pages 108-109. Those records reported in thousandths have been rounded to the nearest hundredths. Monthly and annual totals and means are included.

EVAPORATION CHARACTERISTICS

Evaporation is generally correlated with seasonal and local variations in rainfall, as illustrated in Plate 9. Minimum evaporation occurs in the wet month of February and the maximum during the dry summer months of June through August, the seasonal difference being substantial. Evaporation at wet windward stations follows a characteristic pattern, whereas there is no predictable pattern among leeward stations.

Wind

WIND STATIONS AND RECORDS

There is scant published wind information for the island of Hawaii. Airport and harbor weather stations traditionally maintain continuous wind records for operational requirements and provide much of the long-term wind data.

The first wind station on the island was established by the U.S. Weather Bureau in 1917 at Hawi (No. 161), near the northern tip of the island. At present, there are 20 active wind stations on Hawaii, shown on Plate 10, together with 27 stations now inactive.

Most of the recently installed wind stations are located at lower elevations on sugar plantations in the Kau, Hamakua, and North Kohala Districts, where overhead sprinklers are used for supplemental irrigation. Wind data are obtained at the Mauna Loa Observatory Station (No. 39) maintained by the U. S. Weather Bureau at 11,145 feet. Readings at low elevation on the lee side of the island are obtained by stations at Kawaihae (No. 148) and Kona Airport (No. 68.3).

Wind Station Index, pages 113-114, lists 45 stations having available records, of which 20 are active. Many stations having records of short duration were established for specific projects, such as the location of an air strip, or determination of wave action in planning harbor channels, or for scientific research. A cross reference to the numerical listing in the Index is presented in the Alphabetical List of Climatologic Stations, pages 9-11. (See Rainfall section of this report for climatologic station numbering system.)

There is little uniformity in the records kept by various wind stations on the island. If all record variations were to be published, a different format would be required for practically every station. Therefore, only representative records have been published in Selected Wind Records, page 115. Monthly average wind velocity is given, together with the maximum velocity for each month and the direction from which it originates. Monthly and annual means have been derived for average velocity.

WIND CHARACTERISTICS

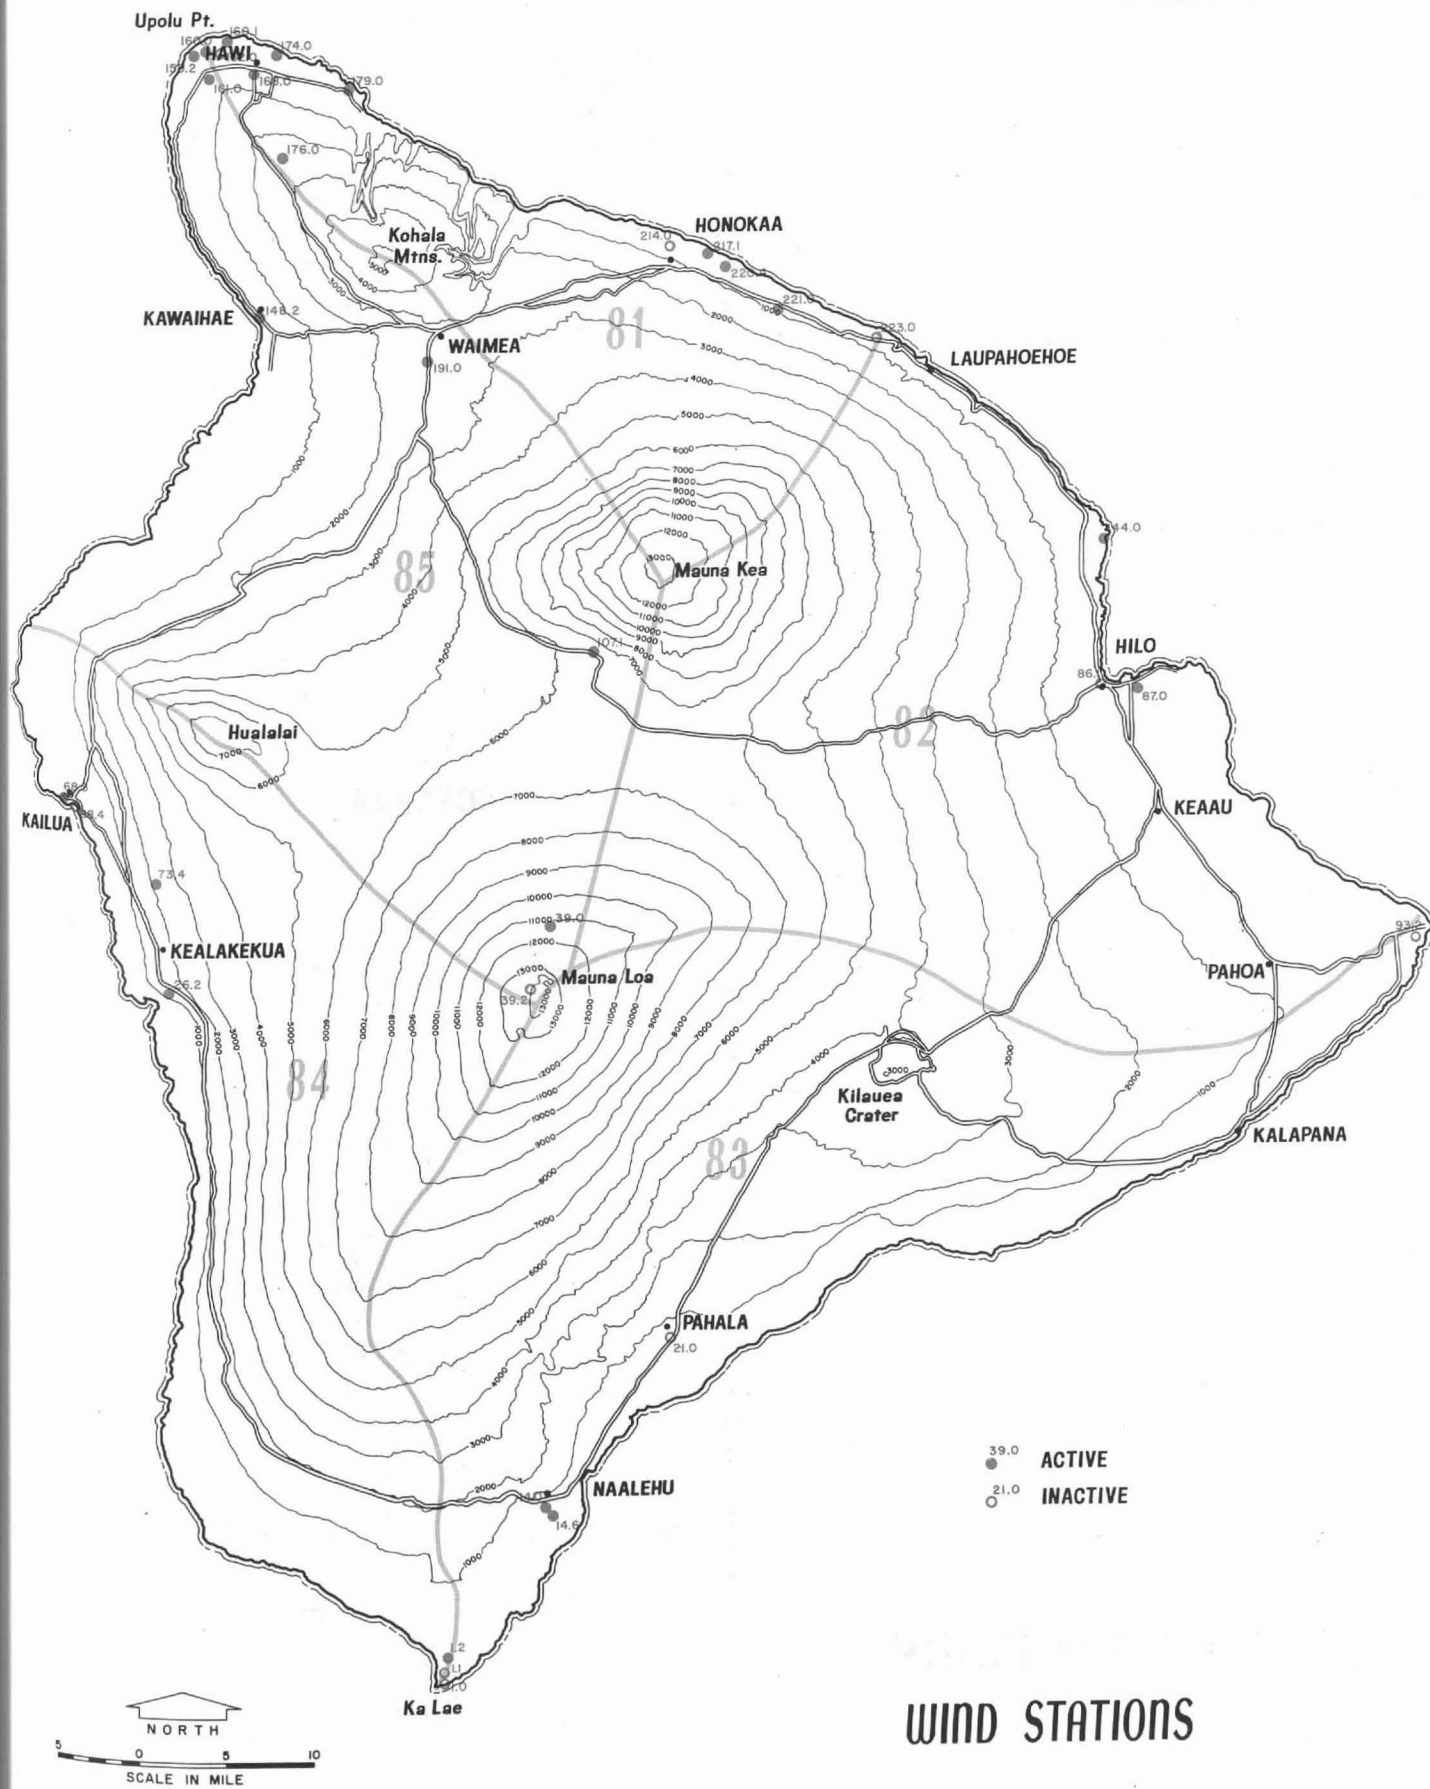

Northeasterly tradewinds prevail much of the time on the island of Hawaii, as elsewhere in the state. Although these winds approach the island at a fairly constant speed, the uniform flow is distorted as the tradewinds traverse the island and combine with local winds on the mountain slopes and lowlands to form complex wind patterns.

The characteristic inversion level of 5,000 to 7,000 feet elevation is the tradewind ceiling. (See Temperature section of this report.) Tradewinds are forced around the mountain masses of Mauna Loa and Mauna Kea, which penetrate the inversion level, losing velocity laterally along the slopes with distance from the northeasterly impact area. Tradewinds pass over Kohala Mountain, the summit of which is generally below the inversion level, losing velocity down the leeward slopes with distance from the summit.

During the cooler winter months, especially, the trades are replaced by other general winds, primarily the southerlies. Occasional tropical storms also generate winds from various directions.

Over the ocean surrounding the island, average wind speeds are highest during the summer tradewind period, exceeding 12 miles per hour 50 percent of the time. During the winter months, wind speeds exceed 12 miles per hour about 40 percent of the time. However, occasional high winds with speeds exceeding the summer trades occur during the winter months.

Wind roses depicting speed and direction at selected stations are shown in Plate 11. The wind roses for Hilo and Honokaa, lying on the windward side of the island, reflect the direct impact of the dominant tradewinds. At Kamuela, located in the saddle of Mauna Kea and Kohala Mountain, distortion of the trades by the mountain masses is evident. A pronounced variation in wind direction is shown at the leeward Kawaihae station, where velocities are comparatively low.

Anemometer at Waimea, Station No. 191.4, measures wind velocity near evaporation pan for correlation of climatologic data.

Humidity

HUMIDITY STATIONS AND RECORDS

Humidity measurements are expressed in relative terms, the volume of moisture in the air compared to the volume in totally saturated air. There are 24 active humidity stations on the island of Hawaii, 16 of which are located in the coastal band below the 2,000-foot contour; the remainder lie on the upper slopes of Mauna Kea and Mauna Loa. The highest concentration of both active and inactive humidity stations is in the Kau District, where instruments are maintained by Hutchinson Sugar Co. and Hawaiian Agriculture Co.

Many humidity stations on the island utilize hygrothermographs for data collection, and practically all measure other climatological elements as well. Humidity measurements, in conjunction with temperature measurements, provide a temperature-humidity index useful in scientific research and experimentation.

The 54 climatologic stations recording humidity information, 30 of which are inactive, are listed in the Humidity Station Index, pages

119-120. A cross reference to the numerical listing is presented in the Alphabetical List of Climatologic Stations, pages 9-11. (See Rainfall section of this report for climatologic station numbering system.)

The earliest indexed station was established in 1939 at the Upolu Point Airport, North Kohala (No. 160.1), and the most recently was established in 1968 by Hutchinson Sugar Co. at Naalehu Airstrip, Kau (No. 13.7). Although most stations have short periods of record, those maintained

Hygrothermograph for measuring humidity.

by the U.S. Weather Bureau at the airports have comparatively long periods.

Humidity station data were not available for publication in this report.

HUMIDITY CHARACTERISTICS

Like other climatological elements measured on the island of Hawaii, humidity is affected by topography. Under prevailing trade-wind conditions, from 50 to 70 percent of the time, moisture distribution in the air surrounding the island mass is greatly influenced by the characteristic temperature inversion. (See Temperature section of this report.) Moisture is high and well distributed below the inversion level, which varies between 5,000 and 7,000 feet elevation; air above the inversion is comparatively dry.

Relative humidity below the inversion is roughly 70 to 80 percent in windward areas, as compared to 60 to 70 percent in the drier leeward areas. Above the inversion, relative humidity is generally less than 40 percent, often declining to 10 or even 5 percent.

Shelter houses hygrothermograph and thermometer at Waimea, Station No. 191.4.

Whether occurring as surface water or ground water, all water supplies on the island of Hawaii are derived from rainfall. Surface water includes runoff flowing in streams and ditches; ground water is percolated rainfall perched on impervious media, confined by dikes, or stored in basal aquifers. High-level ground water issuing as springs or developed by tunnels also contributes to stream and ditch flow. Basal water is developed by dug wells along the coast, by drilled wells, and by shafts (Maui-type wells) which skim the basal aquifers.

Stream flow occurs and ditches have been developed mainly in windward areas. There are few perennial streams because of the high rate of percolation into young lavas, sparse vegetation, and steep-sided stream beds. Most of the water developed at high levels by ditches and tunnels has been used by the sugar industry for fluming cane, irrigation, power generation, and mill operations. With improved technology, most of the tunnels and ditches have been abandoned.

Drilled wells at Kahaluu and Keei in the Kona region and at Pahoa supply domestic water needs. Elsewhere, well water supplements other domestic supplies. Most shafts on the island of Hawaii were developed by plantations primarily for industrial use, but also supply domestic water. Shaft No. 7 at Olaa serves Keaau, Kurtistown, and Mountain View.

In periods of low rainfall, stream flow along the windward coast is sustained largely by springs. Spring water supplies the domestic requirements of small communities along the Hamakua coast, and Kaumana Spring (No. 133) is a principal source for the city of Hilo.

Water quality characteristics vary physically, chemically, and bacteriologically, depending largely upon organic substances present in surface supplies and geologic conditions prevailing at ground water sources. Domestic water supplies are generally colorless and odorless, except for colored surface water from Kohala Mountain used at Kamuela and Kawaihae.

This section inventories surface water and ground water sources on the island of Hawaii, including discussion of records relating to and characteristics of stream flow, ground water, and water quality. Stream gage stations, ground water sources, and water quality sampling sites are separately indexed, and selected records are presented.

WATER SUPPLY

Stream flow from runoff and perched springs plunges over Akaka Falls in Kolekole Stream.

Stream Flow

STREAM GAGE STATIONS AND RECORDS

Stream flow records on the island of Hawaii have been kept since April 1911 by the U.S. Geological Survey (U.S.G.S.). Several other agencies had previously obtained stream flow records, including sugar plantations and ditch companies whose stream flow measurements are geared to sugar production programs. Many still maintain records of stream and ditch flows. The U.S.G.S. currently operates 35 stream and ditch flow gaging stations on the island of Hawaii as part of its state-wide program of surface water measurement, which is financed by federal and state matching funds.

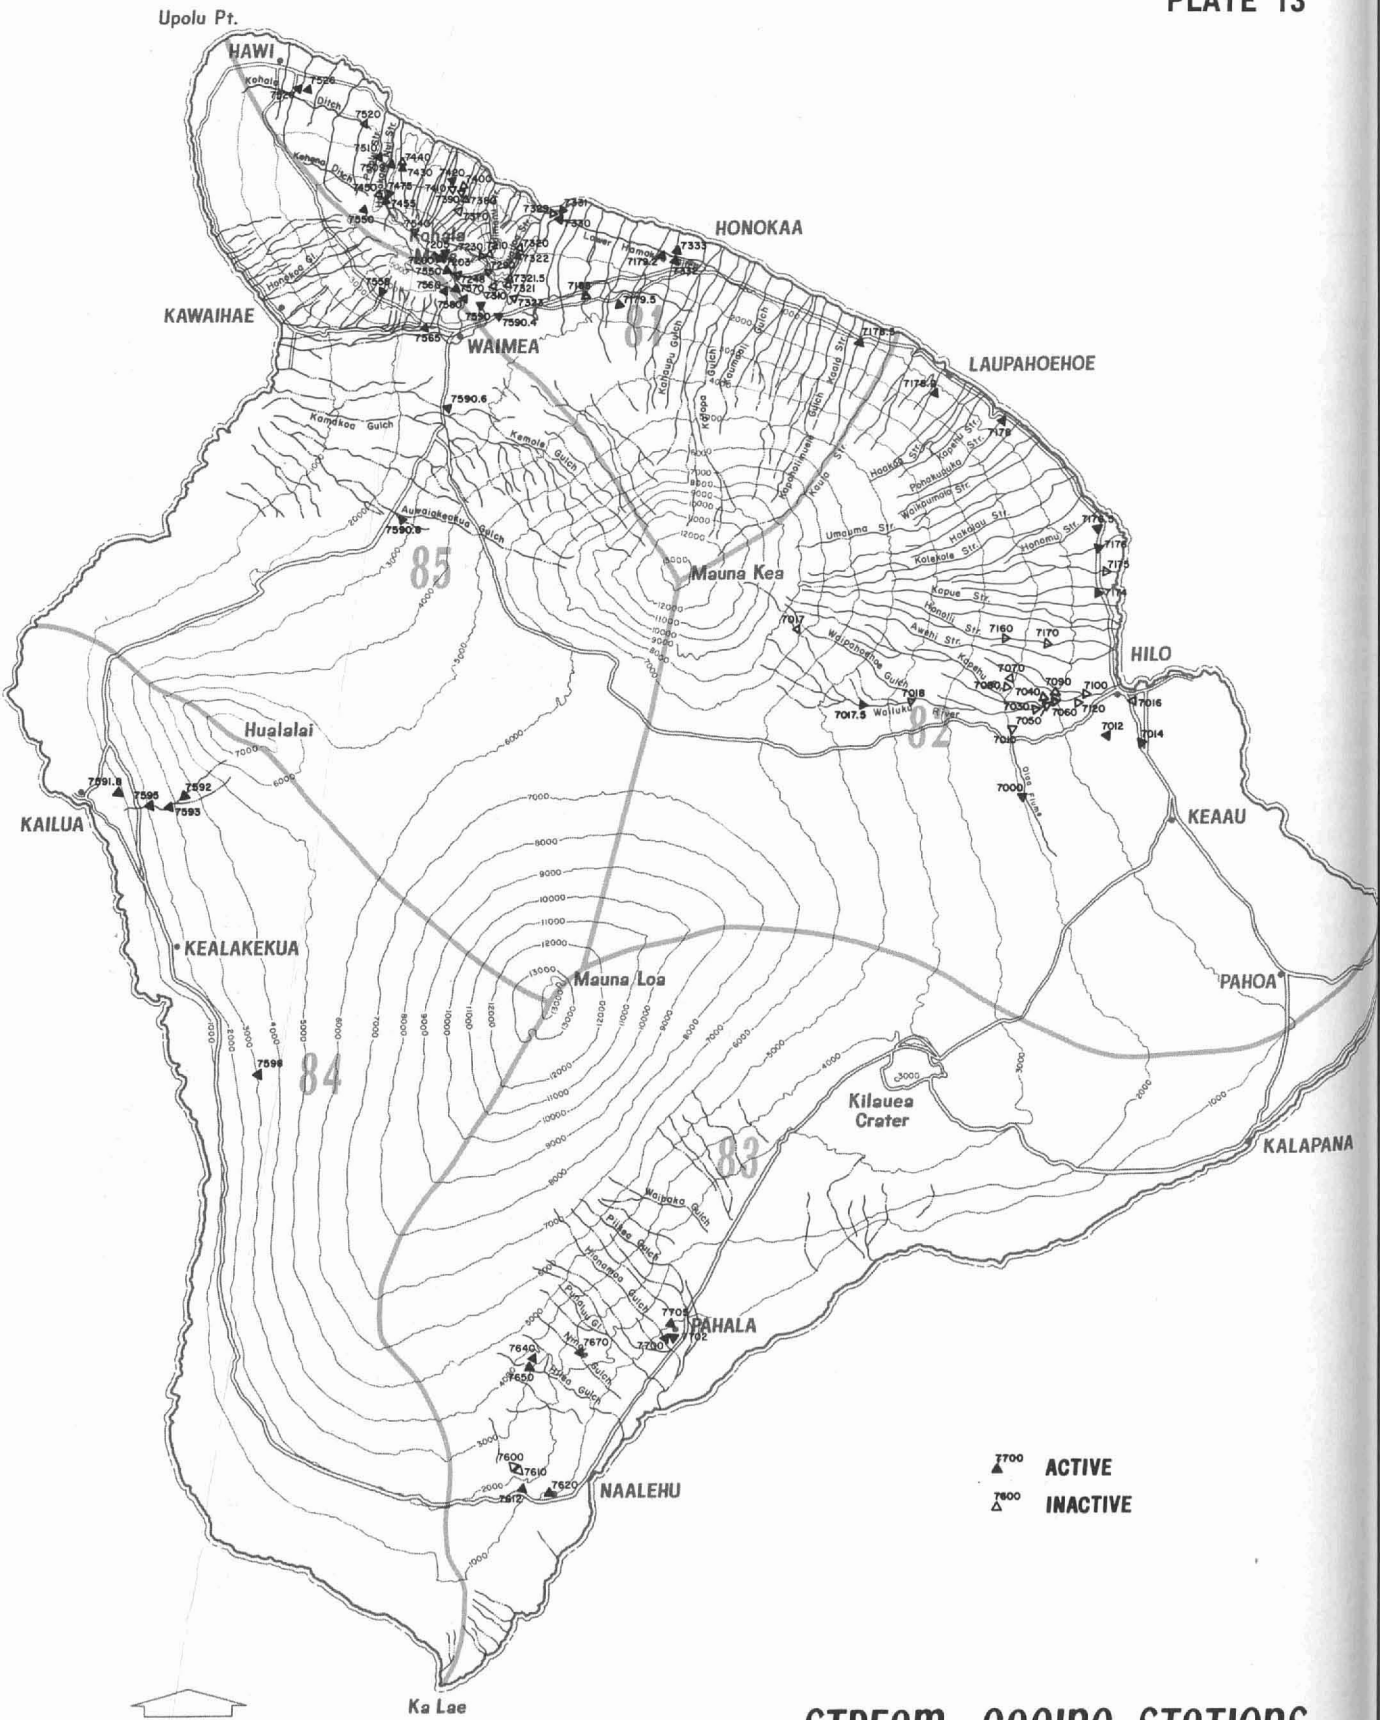

Through June 1960, records of daily discharge and stage of streams were published by the U.S.G.S. in an annual series of Water Supply Papers entitled *Surface Water Supply of Hawaii*. Beginning with the 1961 fiscal year, daily discharge records have been published annually in the same format, but in a new series entitled *Water Resources Data for Hawaii and Other Pacific Areas*. Records of peak flows during

each fiscal year, obtained from stream gages and crest gages, have been published annually by the U.S.G.S. since 1958 in *An Investigation of Floods in Hawaii*. Annual reports, unlike the U.S.G.S. Water Supply Papers, are primarily for local needs, and distribution is limited. At 5-year intervals, compiled stream flow records are published as U.S.G.S. Water Supply Papers.

Stream flow records for the gaging stations in the state, summarized on a monthly and yearly basis, have been published in several reports to date. In 1939 the Territorial Planning Board published a summary of records of stream and ditch flow in *Surface Water Resources of the Territory of Hawaii, 1901-1938*, which includes hitherto unpublished as well as published records available to December 1938. Monthly and yearly summaries of stream flow data collected by the U.S.G.S. are presented in its Water Supply Paper 1319, *Compilation of Records of Surface Waters of Hawaii through June 1950*. Included in this publication are some records furnished by other agencies. A supplemental summary covering the period July 1950 to June 1960 is presented in the U.S.G.S. Water Supply Paper 1739.

HILO STREAMS

FLOW DURATION CURVES FOR SELECTED STREAMS

Station No. 7590, Hanani Stream, South Kohala, showing dam for water-stage recorder.

The locations of stream gage stations for which records are regularly published, most of which are official stations maintained by the U.S.G.S., are shown on Plate 13. Of the 92 stream gage stations plotted, 35 are active and 57 are discontinued.

As Plate 13 shows, the majority of the active stream gages are located in the Kohala and Hilo areas. Elsewhere on the island, the collection of stream flow data is sparse. This is particularly evident along the Hamakua coast south of Waipio Valley and in the Kau area, where the existence of intermittent and some perennial streams might warrant expansion of the streamflow measurement network.

Continuous collection of data on every stream is neither physically possible nor economically justifiable. Yet, burgeoning land developments in various locations about the island indicate the need for a broadened gaging network to better assess the island's surface water resources. The existing distribution of stream gage stations carries over from earlier years when principle emphasis was upon the sta-

tions' usefulness in the development and operation of special projects, primarily irrigation water supplies for sugar production. A study to determine the adequacy of the stream gage station network on the island of Hawaii is part of a current project to re-evaluate the state's overall stream flow measurement program.

Stream Gage Station Index, pages 129-133, lists the 35 stations on the island of Hawaii which are active and 108 which are inactive. Stations are listed numerically in accordance with an 8-digit system used by the U.S.G.S. Each station is assigned 6 digits, following the Pacific area number "40". Stations are numbered, by islands, from Kauai in a southwesterly direction to Hawaii. On each island, stations are numbered counter-clockwise. Gaging stations on the island of Hawaii begin with the number 40-7000.00. (In this report, the nonessential zeros are omitted.) Stations along any one stream are numbered in downstream order.

The Index does not present an absolutely complete list of all stream gage stations. Inactive crest gage stations are not included, nor are many of the sugar plantation ditch flow measuring stations maintained for operations management. Also excluded from the Index are stations where non-scheduled "miscellaneous" measurements are made for special purposes. Information on these latter stations may be obtained from U.S.G.S. Water Supply Papers.

Selected stream flow data and available ditch flow data on the island of Hawaii are presented in Selected Stream Flow Records, pages 134-137. Stream flow records include data for streams having at least one complete year of record, including discontinued stations. The figures represent flows passing the respective stations, with no adjustments for possible storage or diversions. The mean monthly discharge for a station is the average of the tabulated monthly mean discharges; the mean annual discharge is the average of all complete years of record.

STREAM FLOW CHARACTERISTICS

Runoff on the island of Hawaii varies locally and from time to time in response to variations in rainfall. The relatively young, slightly dissected domes comprising the island have gentle slopes and little soil. The unweathered and highly permeable lavas allow much of the rainfall to percolate to the water table. Hence, there are few perennial streams on the island. Many in areas of moderate rainfall are perennial in their upper reaches, with flows reaching the coast only during periods of sustained rainfall.

Streams of any consequence are located in the windward areas of higher rainfall, and practically all of the perennial streams are on the windward slopes of Kohala Mountain and Mauna Kea. Elsewhere, streams are intermittent or non-existent. Runoff is greatest in the Wailuku River drainage area, where average daily stream flow at 1,070 feet elevation is about 177 mgd.

Plate 14 shows flow duration curves for neighboring streams in the Hilo and Waimea areas and the Waimanu basin in Kohala. The several streams plotted on each graph indicate the similarity of flow characteristics within each area, and a comparison of the respective graphs reveals the general similarity of flow characteristics on the island. The curves are derived

from tables in the U.S.G.S. publication, *Flow Characteristics of Selected Streams in Hawaii*.

The shape of the duration curve is an index of the natural storage within a drainage area, including ground water storage, utilized by the stream. The more nearly horizontal the curve, the greater the storage effect. During dry weather, stream flow is almost entirely from ground water sources, primarily seepage near ground surface. A flow duration curve with a well sustained lower end suggests large ground water bodies with high yield draining slowly into the streams. The lower ends of duration curves, therefore, generally indicate the characteristics of the shallower ground water bodies in the watershed above the gaging station.

Picturesque Luauwai Reservoir in North Kona, used by Huehue Ranch for domestic water supply and livestock purposes, is one of the very few water storage facilities located along Waiaha Stream.

At Station No. 7560, Kohakohau Stream, South Kohala, digital water-stage recorder is housed at right. Cable car is used to obtain stream velocity measurements for determination of flood flow.

Installation at Station No. 7580, Waikoloa Stream at Marine Dam, South Kohala, includes a concrete control dam and, to the left, structure housing a water-stage recorder.

Ground Water

GROUND WATER OCCURRENCE

Ground water on the island of Hawaii can be classified into four general categories: (1) basal water floating on salt water; (2) dike-confined water; (3) water perched on relatively impervious soil or rock formations; and (4) shallow ground water.

Kohala Area. A considerable volume of water discharges into the sea from streams on the wet northeastern slope of Kohala Mountain. Some of the water is derived from overflow of high-level dike compartments, and numerous springs discharge from the interstratified soil beds. Because of the high permeability of the lavas, it is believed that a large volume of fresh basal water is also discharged into the sea.

Toward the northern tip of the island, the more weathered rock retards the mixing of sea water and fresh basal water, and wells sunk in this area have developed water suitable for irrigation. On the lee side of the mountain, the rock is unweathered and rainfall is low; hence, there are no perennial streams, and relatively little basal water moves seaward.

Hamakua and North Hilo Area. On the east

Intake No. 3 at Manowaiopae, Spring No. 50, one of a series supplying Laupahoe town.

and northeast slopes of Mauna Kea, there are many small springs which discharge water perched on ash beds and the dense central cones of aa lava flows. In general, the perching formations are not entirely impervious, and much of the rain water percolates to the basal water table. Basal water is brackish along the coast but is of good quality farther inland.

Puna and South Hilo Areas. These areas comprise the eastern slopes of Kilauea and Mauna Loa. Basal water underlies both areas, with the possible exception of the east rift zone of Kilauea, where water may be impounded by dikes at higher levels. Rainfall and recharge are high, and ground water circulation is probably rapid, so that basal water of good quality is abundant. Only a fraction of this abundant supply of basal water is utilized.

Several large and many small basal springs issue along the coast from Hilo to Kalapana. Perched springs occur on the eastern slope of Mauna Loa near its junction with Mauna Kea. The perching member is Pahala ash, which in this area ranges from 9 to 20 or more feet in thickness and is much less permeable than the overlying lavas.

Kau Area. The coast of Kilauea in the Kau District receives little rain and is mostly barren and rocky. In central Kau along the eastern coast of Mauna Loa, considerable basal water discharges into the sea, primarily in the vicinity of Punaluu where Ninole Spring is located. Potable water is difficult to obtain on the arid western coast of Kau. The lavas along the coast northwest of Kalae (South Point) are very permeable, and sea water encroaches inland for a distance. Ground water is perched on volcanic ash beds in central Kau; elsewhere in Kau there is very little perched water because of the low recharge and unfavorable geologic structure.

Kona Area. Because basal water from wells dug or drilled in the lowland areas of Kona is too saline for human consumption, for many years residents had relied on rain catchments for potable water. Deep wells drilled farther inland, however, now produce clear and potable water. The only ground water at high level occurs in pools in lava tubes and in bogs located in pahoehoe depressions. There are no outcrops of relatively fine-grained ash beds in Kona to perch water, as in Kau, and dike-confined water is believed to occur only at great depths.

Hopukani Springs, located high above the saddle in Pohakuloa Gulch on Mauna Kea, comprises spring sources which feed into collection boxes with intake weirs to provide the principal water supply for the military camp and state park facilities in the saddle.

GROUND WATER SOURCES AND RECORDS

The locations of wells, shafts, tunnels, springs, and drilled testholes on the island of Hawaii are shown on Plate 15.

Records of these ground water sources are sparse, are not uniform or consistent, and may not be comparable. Records published in this report are those available, including original data as well as data published elsewhere.

Drilled Testholes. Drilled Testhole Index, pages 141, 144, lists 34 testholes drilled on the island of Hawaii for hydrogeologic exploration. No testhole records have been compiled or published in this report.

Drilled Wells. Drilled wells on Hawaii totaling 56, including abandoned exploratory wells, are listed in Drilled Well Index, pages 145-147. Such wells generally tap the basal aquifer and are developed primarily for domestic and industrial water supplies. Some brackish wells are used for irrigation purposes.

Two types of drilled well records have been

published in this report: Selected Well Pumpage Records, page 148, and Selected Well Pumping Test Records, pages 149-154. Those limited well pumpage records available are maintained by government agencies, although the wells may be privately owned. Records generally cover the entire year.

Well pumping test data published in this report have been adapted from records submitted by the driller or agency responsible, edited for uniformity to the extent practicable. Only raw data have been reported, without interpretation. Date and time of test, pumping rate, drawdown, chloride content, and temperature have been included in tabular form, together with information on equipment, personnel, and other background details.

Dug Wells and Waterholes. Almost all the shallow dug wells, a large number of them in Kona, tap the basal aquifer in the coastal lowlands about the island. Some dug wells located inland on the mountain slopes develop water perched on ash beds. These dug wells are mostly water holes and ancient Hawaiian wells no longer being utilized.

Shaft No. 5 is the principal source of water for Hamakua Mill Co. and town of Paauilo.

Dug Well and Waterhole Index, including ancient Hawaiian wells, pages 155-157, lists 72 such water sources on the island of Hawaii. Records generally have not been kept for such sources and none are published in this report.

Shafts. Eight of the island's shafts (Maui-type wells) are located on sugar plantations: Nos. 1, 2, 3, and 4 at Kohala Sugar Co. on the northern tip of the island; No. 5 at Hamakua Mill Co. and No. 6 at Kaiwiki Sugar Co.--both on the Hamakua coast; No. 7 at Puna Sugar Co. in Puna; and No. 8 at Hawaiian Agricultural Co. in Kau. No. 9, at Kapoho, is part of the county water system. Shaft Index, page 158, lists all the shafts on the island.

Shafts are dug at an angle to an infiltration tunnel or tunnels which skim the fresh water lens. Records are variously kept of the volume of water pumped, the water level, and chloride content. Some records indicate water use. Selected Shaft Pumpage Records for all plantation company shafts presently in use, including available water level and chloride content data, are

published on pages 159-164. A variety of inconsistent records have been collated and standardized to the extent practicable in order to present a general view of this water source. Original data should be consulted for a more detailed picture of a particular source.

Tunnels. Tunnels have been driven to develop high-level ground water supplies in areas of heavy rainfall where there are perching members or dikes. The windward valleys of North Kohala and the southeast slopes of Mauna Loa in Kau have extensive tunnel development. Tunnels have also been developed, but less extensively, in the vicinity of Paauilo, Ookala, and Papaikou on the Hamakua coast and in the mauka areas southwest of Hilo.

Tunnel Index, pages 155-158, lists 109 tunnels on the island of Hawaii. Most of the tunnels were developed when cane was transported by flumes and not for potable water supplies. The majority have been abandoned and/or integrated into existing water systems which do not record tunnel discharge separately.

Selected Tunnel Discharge Records, pages 169-173, have been published to indicate perched water supplies on the island. Most of the records included are from plantation sources, and some have been published elsewhere. Total monthly and annual discharge data are given.

Springs. Spring Index, pages 174-179, lists 183 sources of spring water on the island of Hawaii.

Springs are most prevalent on the windward side of the island, where rainfall is abundant and there are enough perching members and relatively impervious rocks to prevent or retard percolation. In size, these perched springs range from mere seeps of a few gallons daily to high-volume sources discharging close to a half million gallons daily. The larger springs issue in the major windward valleys of Kohala Mountain and on the eastern slope of Mauna Loa near its junction with Mauna Kea. In central Kau, where perched springs yield moderate supplies of ground water, tunnels have developed several spring sources.

Basal springs yield large quantities of water to the sea. Two of the larger ones are those at the Waiakea estuary in Hilo, which discharges about 100 million gallons daily and at Punaluu in central Kau, which discharges about 25 million gallons daily.

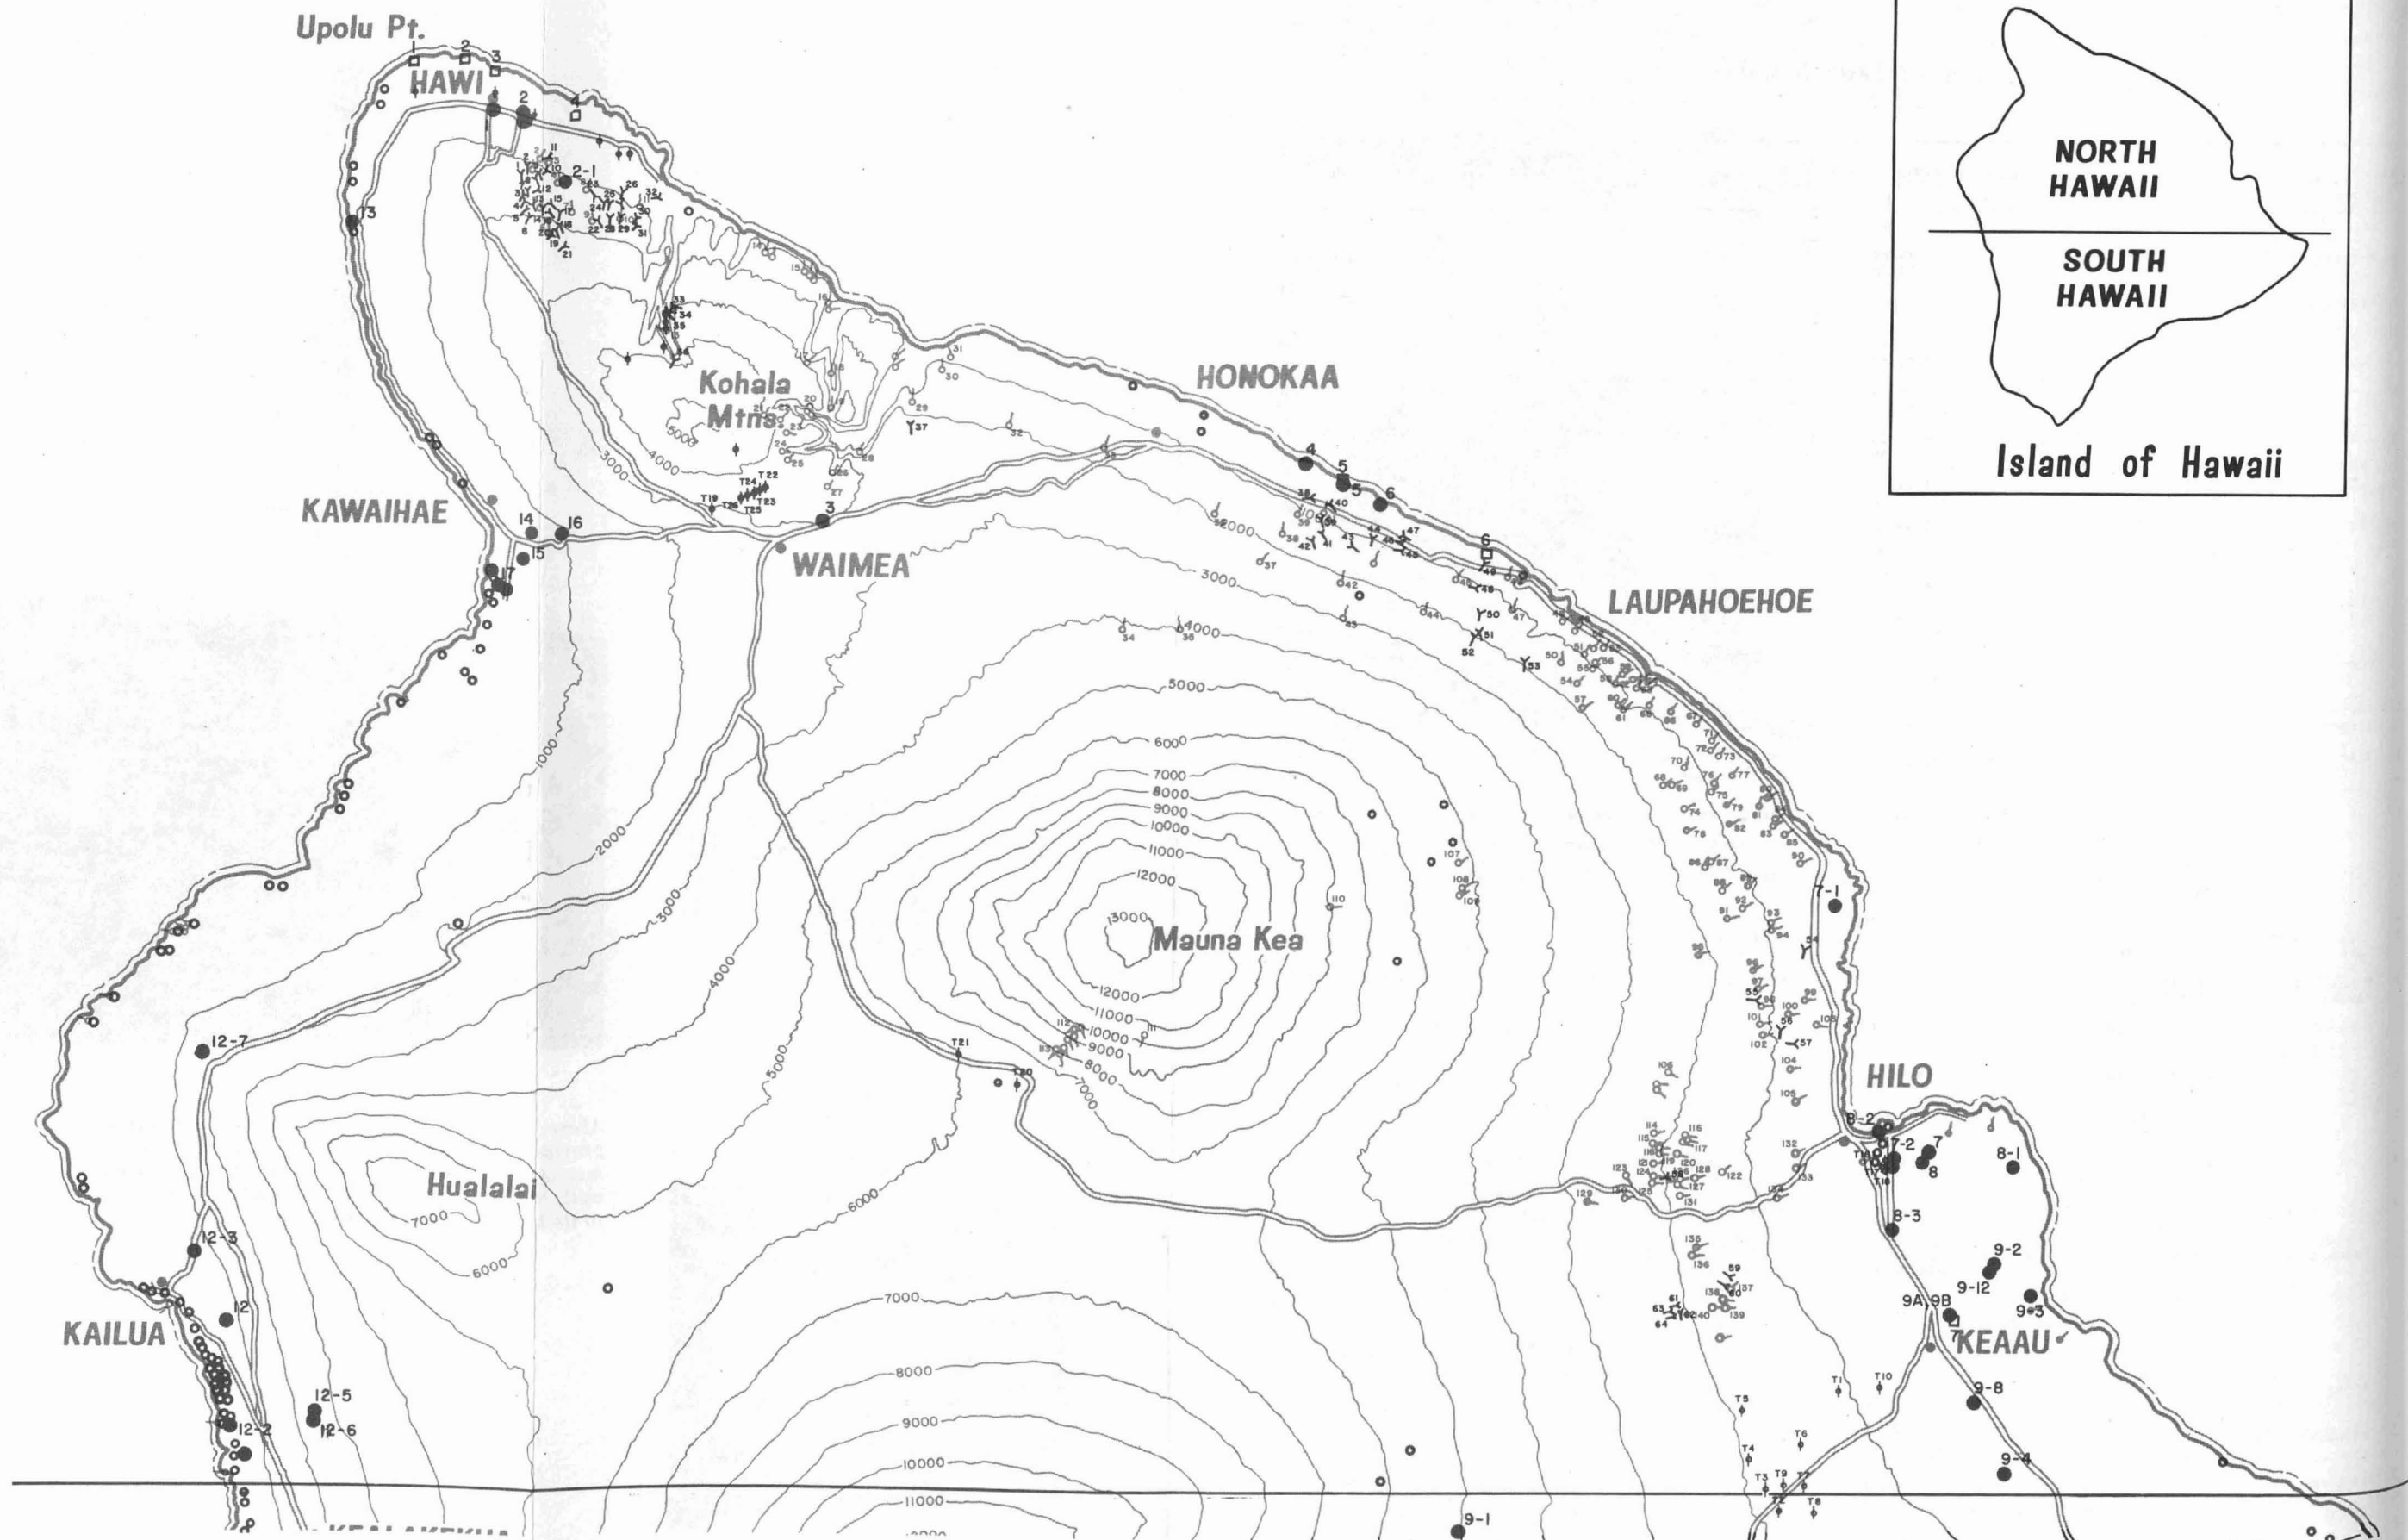

There are few long-term spring records, because reliable sources are usually sealed with an opening and little attention paid to measuring spring flow. Selected Spring Flow Records, page 180, indicate the discharge from springs used for domestic water supplies. Monthly and annual totals are given.

Note: Pumpage in millions of gallons. e - Estimated. *Discontinued June 1, 1963.

Well No. 8-3—PANAewa (pump efficiency test with booster and deepwell operating).

Selected Well Pumping Test Records

Well No. 8-1 — KING'S LANDING

GENERAL INFORMATION

Contractor: Pacific Drilling Co., Ltd.
Elevation top of casing: 38.10 ft.
Total depth of well: 58 ft.
Casing: Diameter, 10 in.; length, 47 ft. (bottom 16 ft. perforated).

PUMPING TEST DATA

Date of pumping test: January 23, 1961
Static water level: 3.37 ft.
Personnel: S. Kawakami, T. Nakahata, Y. Imada, Nakahata, Kaneshige, Imada & Assoc.; S. Wong, State Division of Hydrography; D. Williams, P. Smith, Pacific Drilling Co., Ltd.

Well No. 9-4 — KEAAU (ORCHID LAND ESTATE)

GENERAL INFORMATION

Contractor: Ocean View Drilling Co.
Drilling equipment: Walker Neer WS-31 percussion rig.
Drilling date: June 10-August 5, 1960.
Ground elevation above msl: 426.91 ft.
Total depth of well: 475.00 ft.
Size of hole: 11-1/2 in.
Casing: Inner diameter, 8 in.

PUMPING TEST DATA

Date of pumping test: January 13, 1961.
Elevation centerline air gage: 432.34 ft.
Length of airline: 423.43 ft.
Static water level: 19.00 ft.
Drawdown: 0.93 ft. at 340 gpm.
Recovery: Immediate.
Salinity (chlorides): 6-12 ppm.
Water temperature: 72-74°F.

Well No. 9-5A — PAHOA WELL 2-A

GENERAL INFORMATION

Contractor: Maui Drilling Co., Earl Lee.
Drilling equipment: Percussion (cable-tool) Walker-Neer WS-31.
Drilling date: March 28, 1960-June 1, 1960.
Ground elevation: 704.70 ft.
Total depth of well: 754.70 ft.
Size of hole: 11.5 in.
Elevation bottom of well: -50.00 ft.
Casing: Diameter, 8.5 in.; length, 754 ft. (bottom 72 ft. perforated).

PUMPING TEST DATA (Test No. 1)

Date of pumping test: June 27, 1960.
Length of air line: 719.29 ft.
Elevation center air gage: 707.73 ft.
Depth static water level below center air gage: 690.07 ft.
Elevation static water level: 17.56 ft.
Pump: Red Arrow submersible pump.
Pressure gage: Ashcroft 0-30 psi, 0.1 lb. subdivisions.
Pump discharge meter: Trident 4 in. compound meter.
Personnel: William Chun, William Thompson, Mike Victor, Edmund Hoku, Board of Water Supply, George Kramer, E. Kerwin, E. Kerwin, Maui Drilling Co.; Sam Wong, State Division of Hydrography.

PUMPING TEST DATA (Test No. 2)

Date of pumping test: July 10-14, 1960; August 11-16, 1960.
Duration of pumping test: 165 hrs.
Depth to water level: 686.90 ft.
Length of airline: 719.29 ft.
Elevation centerline air gage: 707.73 ft.
Elevation bottom airline: -11.56 ft.
Airline pressure at start of test: 19.95 psi.
Static water level above msl: 17.80 ft.
Maximum drawdown: 0.462 ft. at 314 gpm.
Rate of recovery: Immediate.
Salinity (chlorides): 2-6 ppm.
Water temperature: 66-74°F.

Well No. 9-6 — KAPOHO

GENERAL INFORMATION

Contractor: Ocean View Drilling Co.
Drilling equipment: Percussion (cable tool) Walker Neer WS 31; Keystone 5D.
Drilling date: September 18, 1960-December 22, 1960.
Ground elevation: 286.75 ft.
Total depth of well: 337.15 ft.
Size of hole: 11-3/4 in.
Elevation bottom of well: -50.40 ft.

PUMPING TEST DATA

Date of pumping test: January 27-30, 1961
Duration of pumping test: 76 hrs.

Depth to water level: 283.60 ft.
Length of airline: 303.02 ft.
Elevation centerline air gage: 290.46 ft.
Elevation bottom airline: -12.56 ft.
Static water level above msl: 3.15 ft.
Maximum drawdown: 1.02 ft. at 317 gpm.
Rate of recovery: Immediate.
Salinity (chlorides): 331-345 ppm.
Water temperature: 92-94°F.

Well No. 9-7 — KEAUOHANA

GENERAL INFORMATION

Contractor: Ocean View Drilling Co.
Drilling equipment: Percussion (cable-tool) Bucyrus-Erie 60-L.
Drilling date: February 8-April 4, 1961.
Ground elevation: 751.75 ft.
Total depth of hole: 801.90 ft.
Size of hole: 12 in.
Elevation bottom of hole: -50.15 ft.
Size of casing: Outer diameter, 8-5/8 in.; inner diameter, 8-1/4 in.; thickness, 3/8 in.
Length of perforated casing: 53.50 ft.
Length of solid casing: 746.51 ft.
Depth of gravel pack from bottom: 780.01 ft.
Size of rock used in gravel pack: #3 crushrock.
Depth of grout from top of gravel pack to top of hole: 20.00 ft.

PUMPING TEST DATA

Date of pumping test: May 23-27, 1961.
Duration of pumping test: 98-1/6 hrs.
Depth to water level: 748.81 ft.
Length of airline: 765.07 ft.
Elevation centerline air gage: 756.92 ft.
Elevation bottom airline: -8.15 ft.
Static water level above msl: 2.94 ft.
Maximum drawdown: 0.46 ft. at 311 gpm.
Rate of recovery: Immediate.
Salinity (chlorides): 72-92 ppm.
Water temperature: 73-75°F.

Well No. 9-8 — WAIKAPAHU

GENERAL INFORMATION

Contractor: Ocean View Drilling Co.
Drilling equipment: Percussion (cable-tool) Keystone 50; Bucyrus-Erie 60-L.
Drilling date: December 27, 1960-May 25, 1961.
Ground elevation: 310.68 ft.
Total depth of well: 361.48 ft.
Size of hole: 11-5/8 in.
Elevation bottom of well: 50.72 ft.

PUMPING TEST DATA

Date of pumping test: August 9-10, 1961.
Duration of pumping test: 24 hrs.
Depth to water level: 294.50 ft.
Length of airline: 302.86 ft.
Elevation centerline air gage: 315.11 ft.
Elevation bottom airline: 12.25 ft.
Static water level above msl: 16.18 ft.
Maximum drawdown: 2.89 ft. at 380 gpm.
Rate of recharge: Immediate.
Salinity (chlorides): 6-10 ppm.
Water temperature: 69-73°F.

Well No. 9-9 — MALAMA-KI

GENERAL INFORMATION

Contractor: Ocean View Drilling Co., Ltd.
Drilling equipment: Bucyrus-Erie 22-W percussion rig.
Drilling date: August 30, 1962 (completion).
Ground elevation: 274 ft. above msl.
Total depth of well: 316 ft.
Size of hole: 13 in.
Casing: Outer diameter, 8-5/8 in.; length, 319 ft. (bottom 48 ft. perforated).

PUMPING TEST DATA

Date of pumping test: September 6-7, 1962.
Static water level above msl: +0.56 to +0.86 ft.
Drawdown: 0.07 ft. at 100 gpm; 0.30 ft. at 380 gpm; 0.76 ft. at 480 gpm.

Salinity (chlorides): 5,400 -7,000 ppm.
 Water temperature: 129°F.
 Personnel: Dan Davis, U.S. Geological Survey;
 Stanley Shin, Sam Wong, State
 Division of Water and Land Dev.

Well No. 9-10 — PULAMA

GENERAL INFORMATION

Contractor: Samson and Zerbe.
 Drilling equipment: Bucyrus Erie 60-L percussion rig.
 Drilling date: December 6, 1963 (completion).
 Ground elevation: 230 ft., msl.
 Total depth of well: 250 ft.
 Size of hole: 12 in.
 Casing: Outer diameter, 8 5/8 in.; length, 251.4 ft. (bottom 21.7 ft. perforated).
 Pumping test data:
 Date of pumping test: December 3-6, 1963.
 Test pump: Deep-well turbine, 3-4 ratio gear drive, 23-stage bowl assembly, 165 H.P. diesel engine.
 Pressure gage: Ashcroft 0-30 psi.
 Water meter: 4 in. Hersey-Sparling flowmeter.
 Airline length: 243 ft.
 Airline bottom: -12.41 ft., msl.
 Static water level: 3.41 feet, msl, on December 3, 1963.
 Yield: 50 gpm. with no drawdown.
 Chloride content: 293-298 ppm, at 50 gpm.
 Water temperature: 78.5°F.
 Total pumpage: 329,000 gallons.
 Personnel: Sam Wong, Bob Slarot, State Division of Water and Land Dev.; Steve Bowles, U.S. Geological Survey.

Well No. 9-11 — PAHOA WELL 1

GENERAL INFORMATION

Contractor: Ocean View Drilling Co., Ltd.
 Ground elevation: 402 ft., msl.
 Total depth of well: 446 ft.
 Casing: Diameter, 8 in.; length, 446 ft. (bottom 20 ft. perforated).
 Pumping test data:
 Date of pumping test: May 5-7, 1964.
 Length of airline: 421.87 ft.

PUMPING TEST DATA

Date of pumping test: May 5-7, 1964.
 Length of airline: 421.87 ft.

Elevation center air pressure gage: 404.16 ft.
 Depth static water level below center air gage: 393.57 ft. (Elevation static water level: 10.59 ft. Reading based on final recovery of water level at end of test. No reading taken before pumping because of faulty air gage.)
 Pump: Right angle drive Wintroath turbine pump Ser. No. 9885
 Power: Rockford gasoline power take-off Ser. No. 276573, Model PTA-21119.
 Pressure gage: Ashcroft 30 psi gage.
 Pump discharge: Measured with 6-inch Sparling meter.
 Personnel: George Hacker, Hawaiian Parks, Inc.; Ben Sarasin, Reginald Ho, Max Smith, Oliver Smith, Ocean View Drilling Co., Ltd.; Bill Matsubara, Hawaii County Board of Water Supply; Manabu Tagomori, State Division of Water & Land Dev.

TIME

Well No. 9-12—KEAAU ORCHARD

GENERAL INFORMATION

Contractor: Samson and Zerbe.
Date drilled: August 1964.
Ground elevation above msl: 94.70 ft. (pump block).
Total depth of well: 147 ft.
Casing: Inner diameter, 12 in.; length, 112.5 ft. (uncased hole below).

PUMPING TEST DATA (Test No. 1)

Date of pumping test: January 5, 1965
Equipment: Electric-powered Fairbanks-Morse pump; electric sounding probe; orifice plate.
Personnel: T. W. Vorfeld, Samson and Zerbe Drilling Co.; S. P. Bowles, U.S. Geological Survey.

**Final water-level measurements questionable; electric probe not working properly.

PUMPING-SALINITY DATA

Date of sampling: July 15, 1966
Personnel and method: Sampling and salinity by D.A. Davis and W.J. Hull, using Hach drop bottle; pumping was intermittent to waste through pressure storage tank.
Drawdown: Too small to detect with gage on airline.

PUMPING TEST DATA (Test No. 2)

Date of pumping test: August 23, 1966
Personnel and method: Drawdown tests conducted by Kenneth Fujiyama, with air line water level checked prior to starting the pump. Pump then started and run for 15 min., and first drawdown and salinity tests taken. Salinity measured by titrating with silver nitrate.

Well No. 11—SOUTH POINT AIRPORT

PUMPING TEST DATA

Water level: 53.5 ft. below top of well.
Pumping duration: 2 hrs.
Pumping rate: 30 gpm.
Salinity (NaCl): 50 gr. (at start)
60 gr. (at end).

GENERAL INFORMATION

Driller: Mullin.
Date drilled: April 13-May 2, 1941.
Total depth of well: 63.5 ft.
Casing: 6 in.; 21.5 ft.

GENERAL INFORMATION

Date drilled: August 1940-August 1944
Ground elevation: 595 ft., msl.

Total depth of well: 615 ft.
Casing diameter: 6 in.

Well No. 12-4 — KEEI

GENERAL INFORMATION

Contractor: Samson and Smock, Ltd.
Date of drilling: October 2-December 15, 1958.
Ground elevation: 744 ft., msl.
Total depth of well: 780 ft.
Casing: Outer diameter, 12 in.; length, 769.75 ft.

PUMPING TEST DATA

Date of pumping test: December 17-21, 1958.
Test pump: Byron Jackson 18-L 35 Subette.
Elevation top of casing: 745.95 ft.
Elevation centerline air gage: 746.24 ft.
Length of airline: 753.19 ft.
Static water level: 2.75 ft. (December 17, 1958).
Drawdown: 0.75 ft. at 100 gpm.
Salinity (chlorides): 96 ppm
Personnel: Raymond Chun, Manabu Tagomori, Hawaii Water Authority.

Total water pumped during test: 517,070 gallons.						
Total power used during test: 2,930 KWH.						

Comments:

- Chloride content of water improved with pumping from 200 ppm to 100 ppm and steadied off at that salinity.
- Recovery of water level after stopping pump was almost immediate.
- Average drawdown at pumping rate of 100 gpm was 0.57 foot.

Well No. 12-5 — KAHALUU

GENERAL INFORMATION

Contractor: Pacific Drilling Co., Ltd.
Drilling date: May 1959.
Ground elevation: 833 ft., msl.
Total depth of well: 884 ft.
Casing: Diameter, 12 in.; length 871 ft.

PUMPING TEST DATA

Date of pumping test: May 22-23, 1959.
Static water level: 4.04 ft., msl. (May 21, 1959).
Equipment: Berkeley Submersible Pump; U.S. Supergauge pressure gage; Trident Crest 4-in. flow meter.

Drawdowns:

0.92-9.01 ft. at 100-360 gpm.

Salinity (chlorides):

4-9 ppm.

Personnel:

Lou H. Herschler, Raymond Chun, James Yoshimoto, Sam Wong, Well Drillers.

Well No. 12-8—KEEI (WELL B)						
GENERAL INFORMATION						
Contractor:		Ocean View Drilling Co., Ltd.				
Drilling equipment:		Bucyrus Erie 60-L drill rig.				
Drilling date:		December 20, 1962-April 25, 1963.				
Ground elevation:		737 ft., msl.				
Total depth of well:		774 ft.				
Size of drilled hole:		18 in.				
Casing:		Inner diameter, 12.25 in.; length, 775 ft. (bottom 40 ft. perforated).				
PUMPING TEST DATA						
Date of pumping test:		May 13-16, 1963.				
Static water level:		2.29 ft. (May 3, 1963).				
Salinity (chlorides):		92-105 ppm.				
Drawdown:		0.2 ft. at 270 gpm.				
Water temperature:		65-66°F				
Personnel:		Daniel Lum, Eugene Souza, Sam Wong, Division of Water and Land Development.

Well No. 15 — KAWAHAE WELL 2

GENERAL INFORMATION

Contractor: Samson and Zerbe, Ltd.
 Drilling equipment: Bucyrus Erie 28-L drill rig.
 Drilling date: March 9-June 1, 1961.
 Ground elevation: 392.19 ft., msl.
 Total depth of well: 429.5 ft.
 Size of hole: 15 in.
 Casing: Inner diameter, 10 in.; 428.5 ft. (bottom 40 ft. perforated).

PUMPING TEST DATA

Date of pumping test: June 6-8, 1961.
 Length of airline: 412.60 ft.
 Elevation centerline air gage: 392.19 ft.
 Static water level: 3.3 ft. (electric sounding probe before test); 5.12 ft. (airline after test).
 Salinity (chlorides): 504 ppm.
 Drawdown: 0 ft. at 50, 100, 150, and 180 gpm.
 Water temperature: 79°F.

Well No. 16 — KAWAHAE

GENERAL INFORMATION

Contractor: Ocean View Drilling Co., Ltd.
 Drilling equipment: Falling 2500 rotary drill rig.
 Drilling date: May 18-June 10, 1963.
 Ground elevation: 982 ft., msl.
 Total depth of well: 1,040 ft.
 Size of hole: 10 in.
 Casing: Inner diameter, 8 1/8 in.; length, 1041 ft. (bottom 43 ft. perforated).

PUMPING TEST DATA

Date of pumping test: June 24-28, 1963.
 Static water level: 4.62 ft. (June 24, 1963).
 Salinity (chlorides): 229-264 ppm.
 Drawdown: 2.8 ft. at 100 gpm; 8.5 ft. at 200 gpm.
 Water temperature: 93-96°F.
 Personnel: Daniel Lum, Linford Chang, Ken Sakuma, Division of Water and Land Development; Jack Roseau, U.S. Geological Survey.

Well No. 17 — KAWAHAE (MAUNA KEA RESORT HOTELS)

GENERAL INFORMATION

Contractor: Ocean View Drilling Co., Ltd.
 Drilling equipment: Bucyrus Erie 22-W drilling.
 Drilling date: January 22-March 28, 1963.
 Ground elevation: 188± ft.
 Total depth of well: 218 ft.
 Size of hole: 16 in.
 Casing: Outer diameter 12.75 in.; length 218 ft. (bottom 40 ft. perforated).

PUMPING TEST DATA

Date of pumping test: April 3-5, 1963.
 Static water level: 2± ft.
 Salinity (chlorides): 365-455 ppm.
 Drawdown: 1.0 ft. at 550 gpm.
 Water temperature: 77-78°F.

Spring No. 28—WAIMA VALLEY

Spring No. 49—LAUPAHOEHOE (PALI)

Spring-fed stream flow in Waima Valley, Honokaa.

Water Quality

SAMPLING SITES AND RECORDS

Water quality is usually determined by physical, chemical, and bacterial analysis of samples. The Department of Health is the state agency responsible for collecting and analyzing water samples for potability and pollution control.

As the state pollution control agency, the Department enforces and administers water quality standards relating to all waters within the state as well as coastal waters, as contained in Chapter 37-A, H.R.S., effective in February 1968. This new function is not reflected in this report.

Samples for potability tests have been collected from various water supply and distribution systems at random locations on the island of Hawaii. Plate 16 shows the location of all 61 water quality sampling sites listed in Water Quality Sampling Site Index, pages 183-185. Except at a few locations, water quality samples are not collected on a regular frequency.

All readily available records on physical and chemical characteristics of water samples collected on the island of Hawaii are presented in Selected Water Quality Records, pages 186-188. Bacterial analysis data are not included.

WATER QUALITY CHARACTERISTICS

Surface water on the island of Hawaii is characterized by low concentrations of dissolved solids (salts and mineral constituents) averaging about 64 ppm, and minimal hardness, averaging about 29 ppm. Ground water, by contrast, has considerably higher concentrations of dissolved solids and greater hardness, averaging about 125 and 112 ppm, respectively. Hardness is caused principally by calcium and magnesium compounds, and somewhat by sulfate. The relatively high silica content of ground water on the island is associated with the lava rocks comprising the principal aquifers.

Surface water on Hawaii is not uniformly characterized as any one particular chemical type or class. Either sodium or calcium may be the predominant cation, and bicarbonate, sulfate, or chloride the principal anion. The presence of carbonate and bicarbonate, reported as ppm calcium carbonate, may cause odor and color. Chloride affects taste, and a large amount will

cause corrosion. Most of the chloride content of high-level ground water supplies on the island is probably due to the effect of salt spray carried in moisture-laden tradewinds. Chloride occurring in basal ground water is infiltrated from sea water underlying the fresh water lens.

Acid and alkali balance is expressed as pH. Surface water on Hawaii tends to be somewhat acid because of its exposure to the soil and decomposed organic matter. Ground water from the basal aquifer tends to be alkaline because of its proximity to sea water.

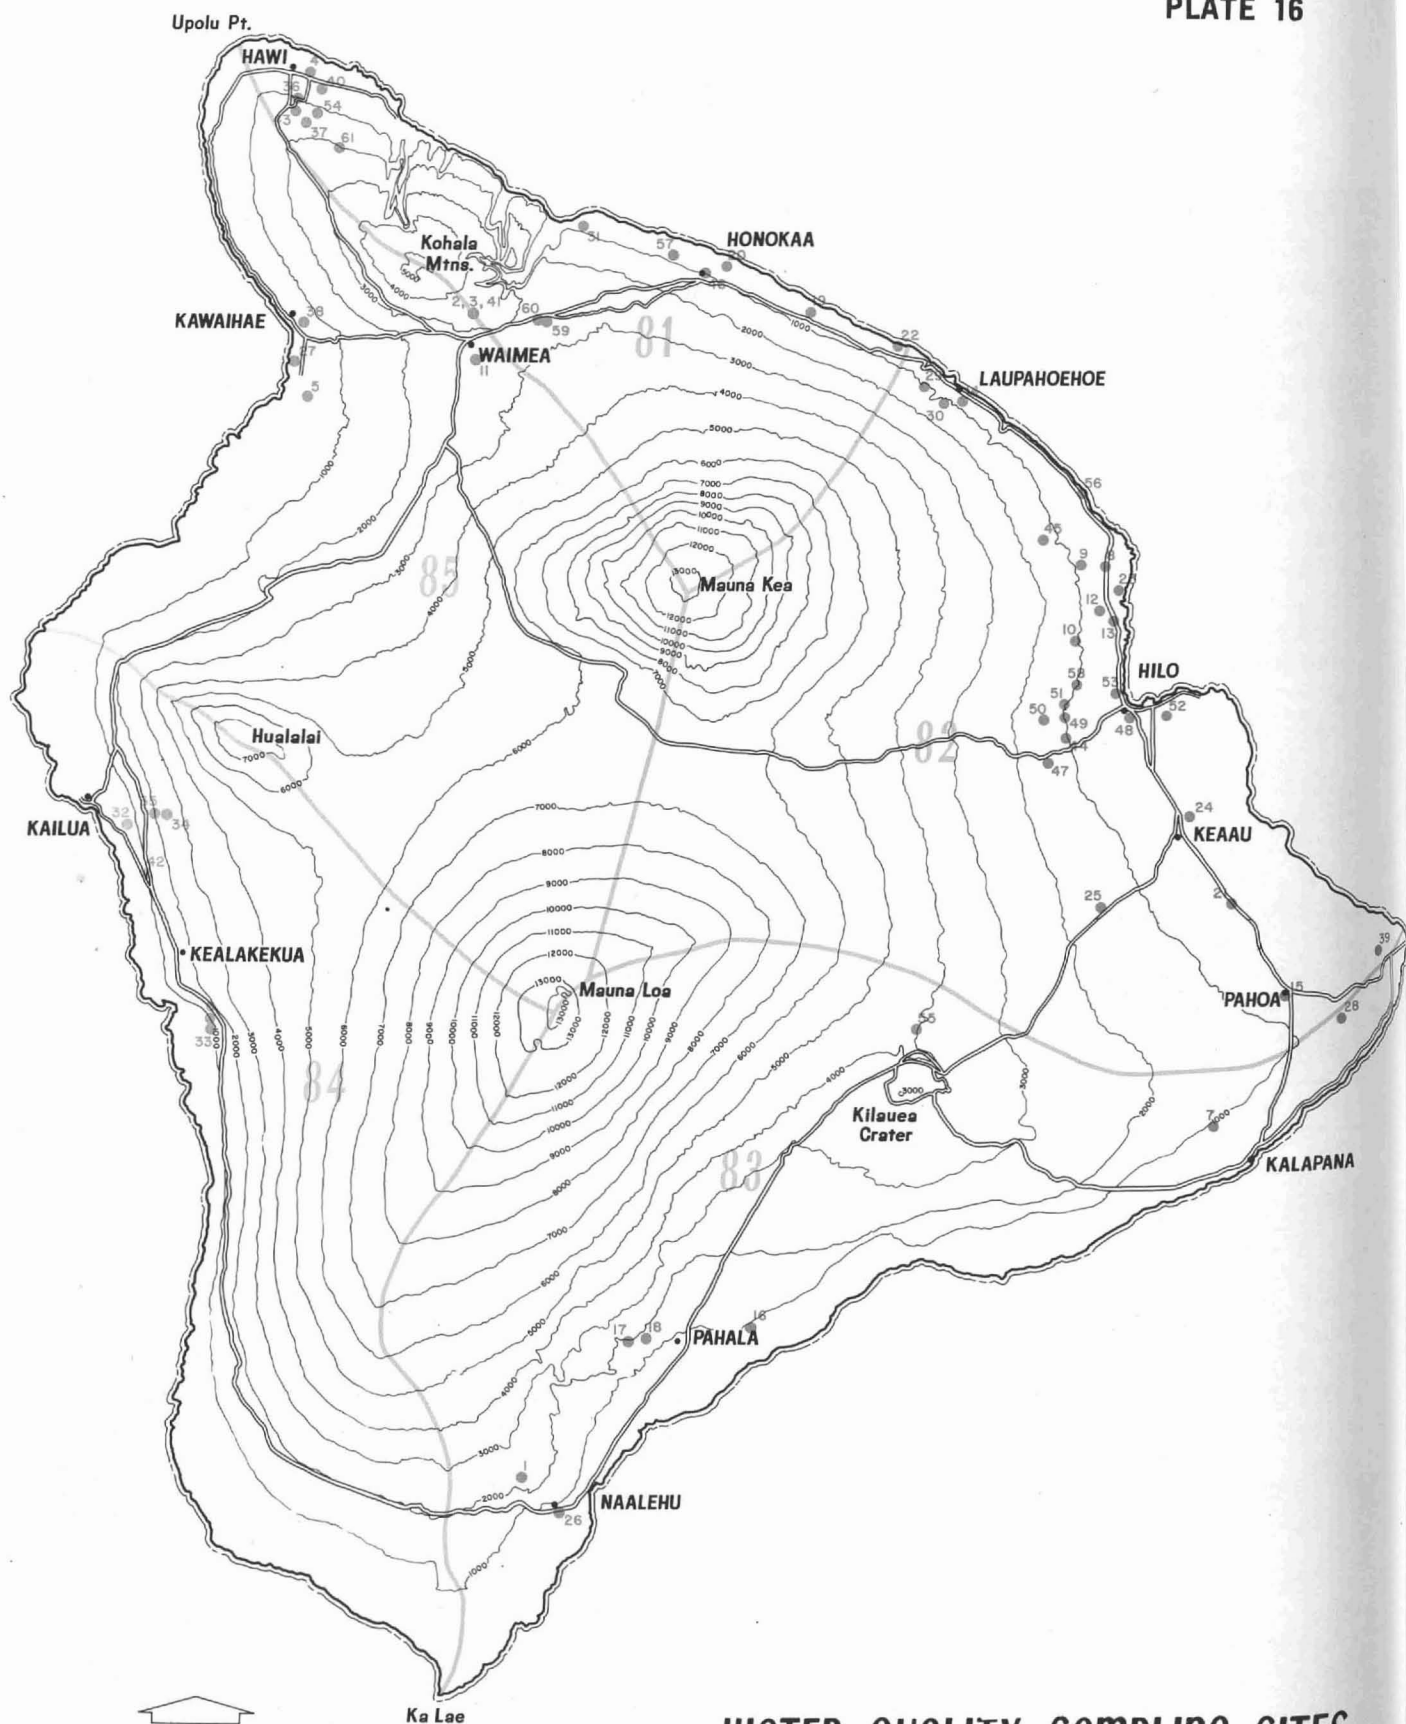

Taste, color, and turbidity are qualities of significance primarily for domestic water supplies. Color and turbidity are objectionable from an aesthetic standpoint. Limits recommended by the U.S. Public Health Service for drinking water supplies are 5 units for turbidity, 15 units for color, and threshold odor number 3.

Where other more suitable supplies are available, the U.S.P.H.S. recommends that chemical substances should not be present in drinking water in excess of the following concentrations (in ppm).

Arsenic	0.01
Chlorides	250
Copper	1
Iron	0.3
Manganese	0.05
Nitrates	45
Phenols	0.001
Sulfate	250
Total Solids	500
Zinc	5

Common characteristics of surface water originating in forested or heavily vegetated watershed areas are turbidity and yellowish brown color. The color bodies in the water are organic in nature, derived from humic and fannic acids in decomposing fern and other flora of the watershed. Studies of the stream waters of Kohala Mountain show that color values reach upwards of 300 units, typical values lying in the 50-100 unit range.

Public water supplies on Hawaii, from both ground and surface sources, contain chemical substances in amounts which are generally well below the recommended limits. However, basal ground water sources in the coastal areas, such as the wells and shafts, are susceptible to contamination from salt water intrusion.
